

# First Light, Galaxy Assembly, & Supermassive Blackhole Growth: Hubble, Webb and other Future Telescopes

---

**Rogier Windhorst (ASU) — JWST Interdisciplinary Scientist**

*Collaborators: S. Cohen, L. Jiang, R. Jansen (ASU), C. Conselice (UK), S. Driver (OZ), & H. Yan (U-MO)*

*(Ex) ASU Grads: N. Hathi, H. Kim, M. Mechtley, R. Ryan, M. Rutkowski, B. Smith, & A. Straughn*

1973~2020<sup>+</sup>;

1996~2031;

2000~2050<sup>+</sup>

2020~2050<sup>+</sup>?

*Public talk at the West Valley Astronomy Club, Sun City, AZ*

*Thursday Nov. 7, 2019. All presented materials are ITAR-cleared.*

# Outline

---

- (1) Update on the James Webb Space Telescope (JWST), 2019.
- (2) What Hubble has done: Galaxy Assembly & SMBH Growth
- (3) How can JWST measure the Epochs of First Light & Galaxy Assembly, and Supermassive Black-Hole Growth?
- (4) The Future: Next generation 20–40 m telescopes & ATLAST
- (5) Summary and Conclusions
  - (6) Update of JWST programmatics as of 2019.
  - (7) How can JWST measure Star-formation & Earth-like exoplanets?
  - (8) Where do our students end-up? Possible NASA Careers

Sponsored by NASA/HST & JWST

**JWST is like a hot bath. It feels good while you're in it; but the longer you stay, the more wrinkled you get.**

**WARNING:** Both Hubble and James Webb are 30–40<sup>+</sup> year projects:  
You will feel wrinkled before you know it ... :)

Edwin P. Hubble (1889–1953) — Carnegie astronomer

James E. Webb (1906–1992) — Second NASA Administrator

Hubble: Concept in 1970's; Made in 1980's; Operational 1990– $\gtrsim$ 2020?.

JWST: The infrared sequel to Hubble from 2021–2026 (–2031?).

**JWST primary  
mirror**

**Hubble primary  
mirror**

JWST  $\simeq 2.5\times$  larger than Hubble, so at  $\sim 2.5\times$  larger wavelengths:  
JWST has the same resolution in the near-IR as Hubble in the optical.

# (1) Update of the James Webb Space Telescope (JWST), 2019

To be used by students & scientists starting 2021 ... It'll be worth it.

(RIGHT) Life-size JWST prototype on the Capitol Mall, May 2007.

# (1) Update of the James Webb Space Telescope as of 2019

- A fully deployable 6.5 meter ( $25 \text{ m}^2$ ) segmented IR telescope for imaging and spectroscopy at  $0.6\text{--}28 \mu\text{m}$  wavelength, to be launched in March 2021.
- Nested array of sun-shields to keep its ambient temperature at 40 K, allowing faint imaging ( $31.5 \text{ mag} \sim 1 \text{ FF}$  from Moon), and spectroscopy.

# THE JAMES WEBB SPACE TELESCOPE

## JWST LAUNCH

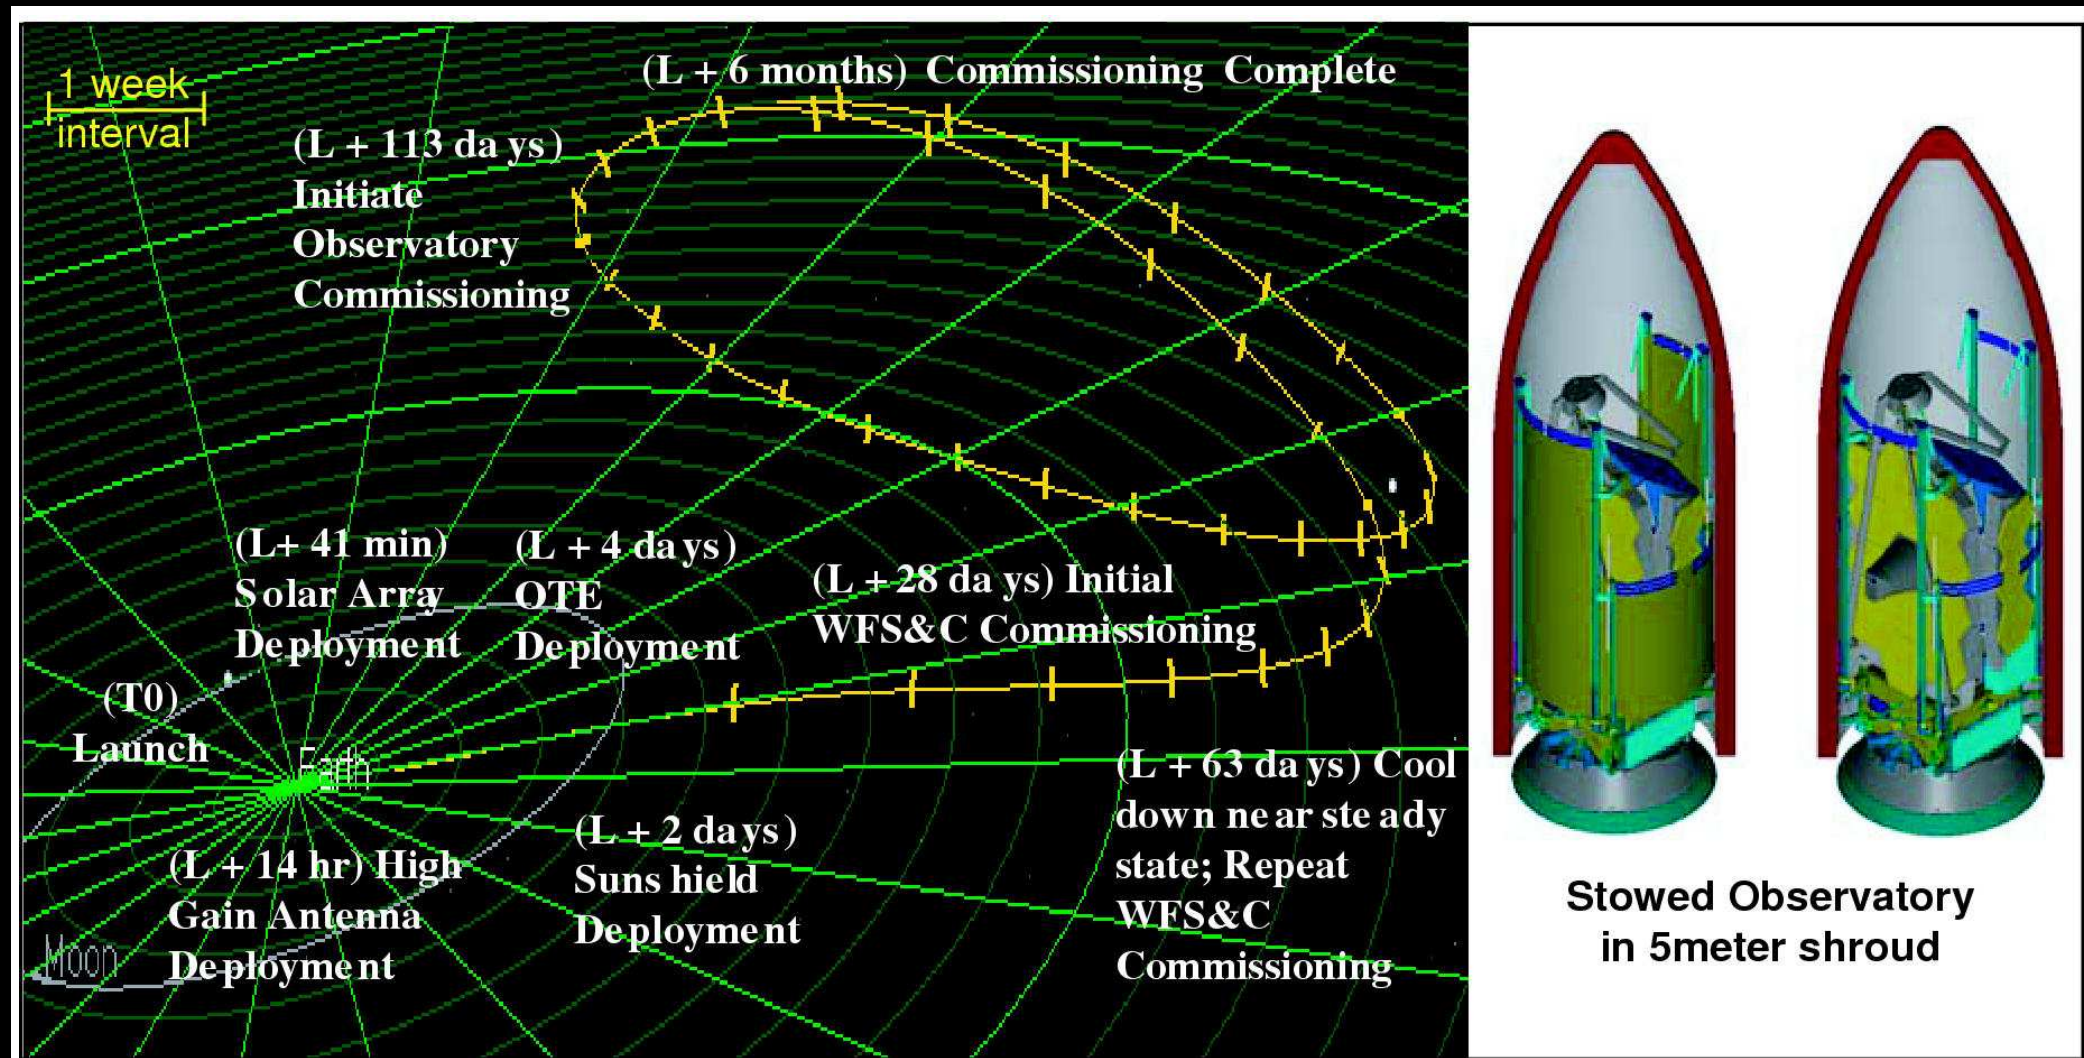

- LAUNCH VEHICLE IS AN ARIANE 5 ROCKET, SUPPLIED BY ESA
- SITE WILL BE THE ARIANESPACE'S ELA-3 LAUNCH COMPLEX NEAR KOUROU, FRENCH GUIANA

ARIANESPACE - ESA - NASA

- The JWST launch weight will be  $\lesssim 6500$  kg, and it will be launched to L2 with an ESA Ariane-V launch vehicle from Kourou in French Guiana.

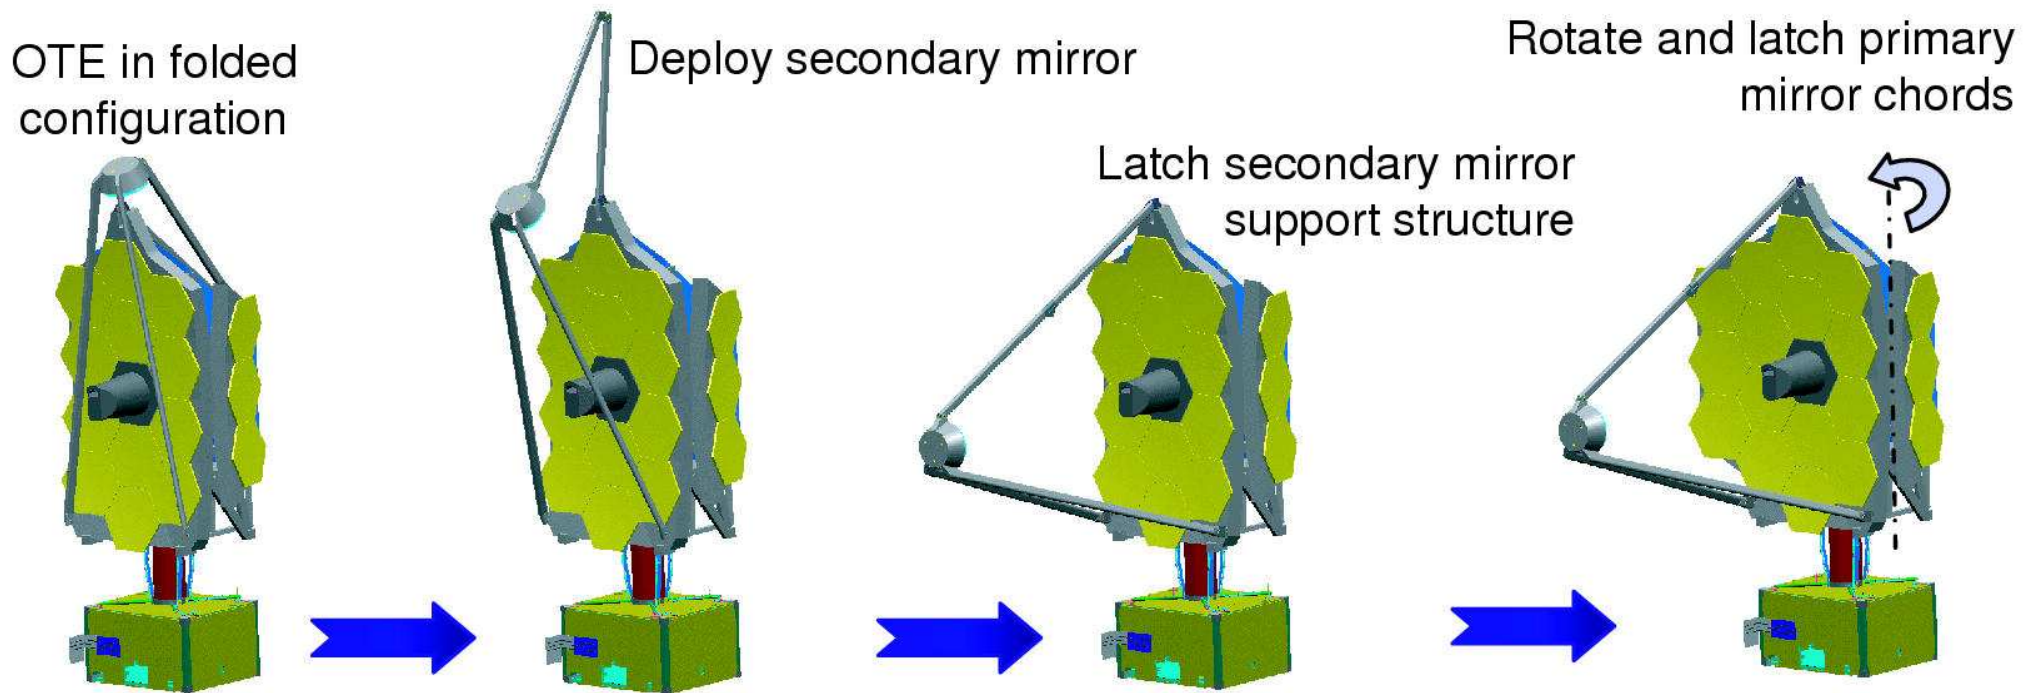

## (1a) How will JWST travel to its L2 orbit?

- After launch in March 2021 with an ESA Ariane-V, JWST will orbit around the Earth–Sun Lagrange point L2, 1.5 million km from Earth.
- JWST can cover the whole sky in segments that move along with the Earth, observe  $\gtrsim 70\%$  of the time, and send data back to Earth every day.

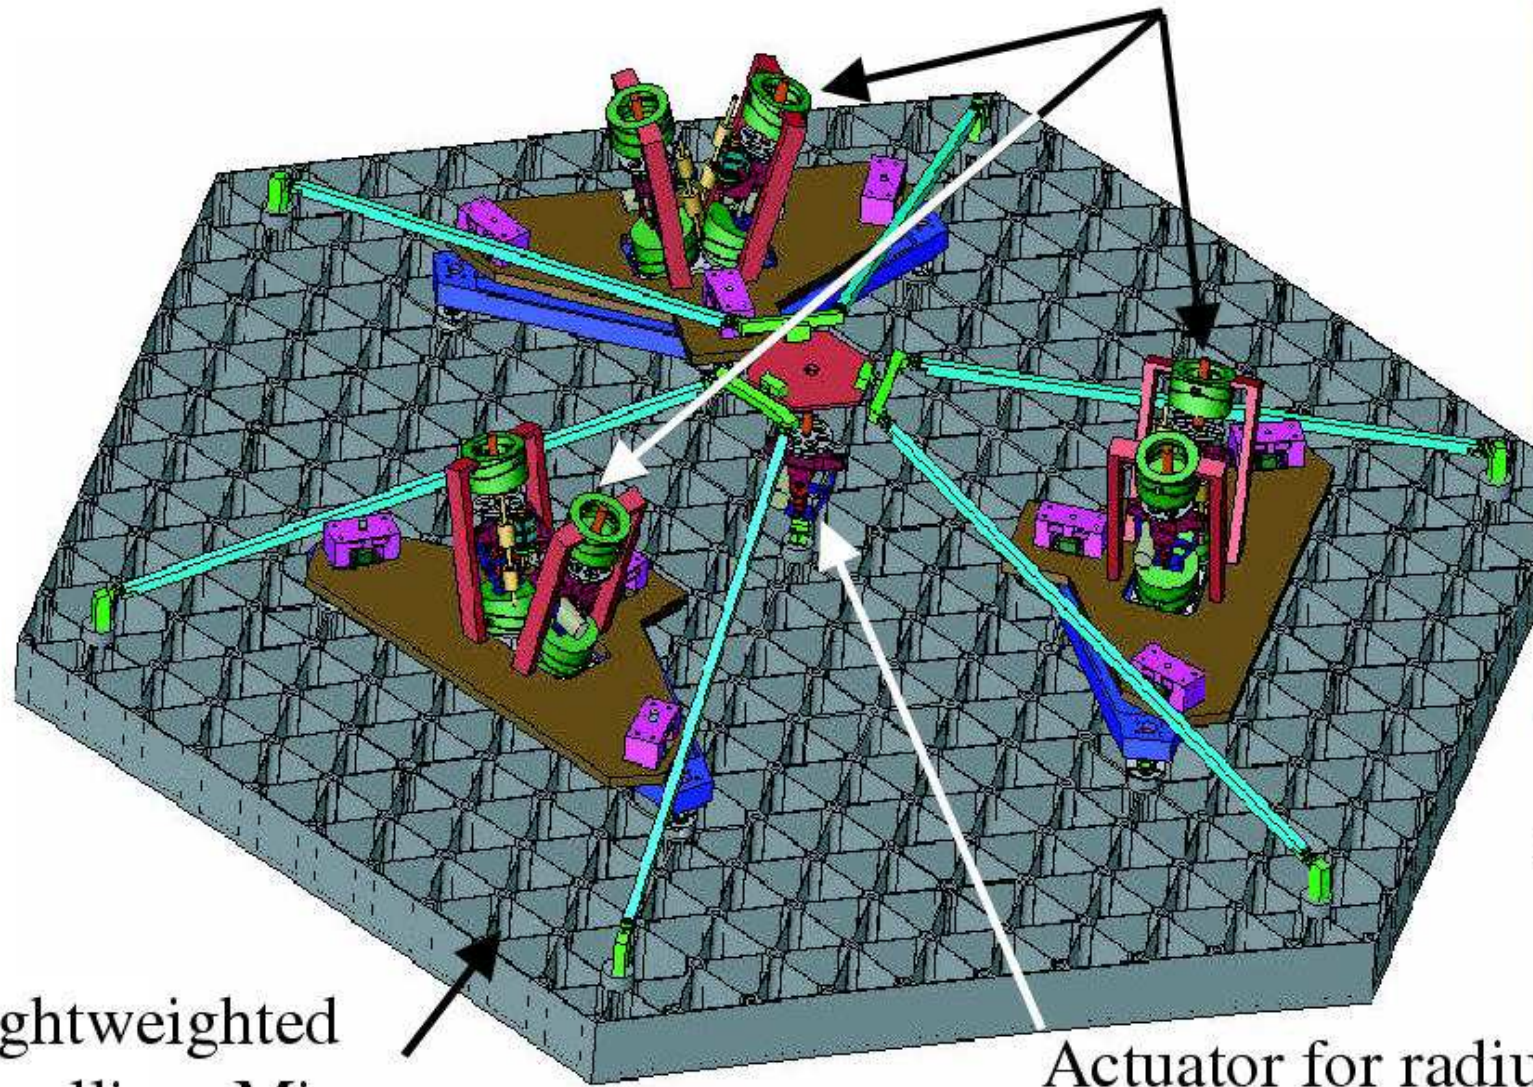

- (1b) How will JWST be automatically deployed?

- During its two month journey to L2, JWST will be automatically deployed, its instruments will be cooled, and be inserted into an L2 orbit.
- The entire JWST deployment sequence is being tested several times on the ground — but only in 1-G: component and system tests in 2014–2019 at GSFC (MD), Northrop (CA), and JSC (Houston).
- Component fabrication, testing, & system integration is on schedule: 18 out of 18 flight mirrors completely done, and meet the 40K specifications.

# Actuators for 6 degrees of freedom rigid body motion

Actuator  
development  
unit

Lightweighted  
Beryllium Mirror

Actuator for radius  
of curvature adjustment

Active mirror segment support through "hexapods", similar to Keck.  
Redundant & doubly-redundant mechanisms, quite forgiving against failures.

# JWST Hardware Status

Primary Mirror Segment

Aft Optics System

PM Flight Backplane

Tertiary Mirror

Secondary Mirror Pathfinder Strut

Fine Steering Mirror

Secondary Mirror Hexapod

ISIM Flight Bench

Secondary Mirror

Membrane Mgmt

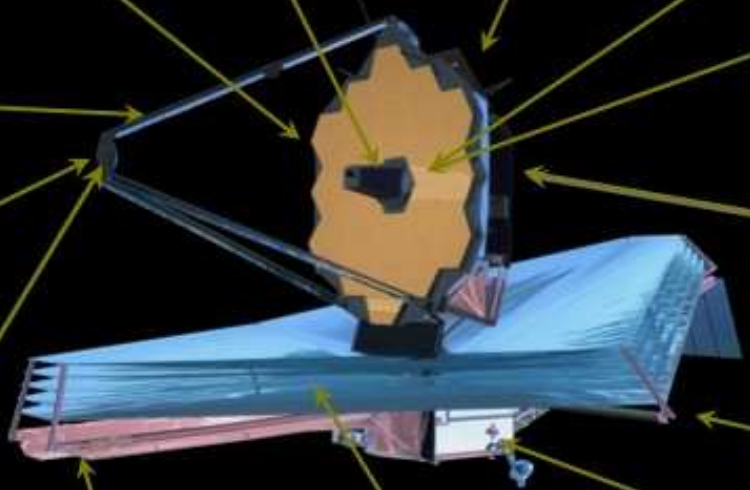

Pathfinder Membrane

Spacecraft computer Test Unit

Mid-boom Test

Fall 2019:  $\approx 99.5\%$  of launch mass designed and built ( $\approx 99\%$  weighed).

# TELESCOPE ARCHITECTURE

3/31/11

2014–2019: Complete system integration at GSFC and Northrop.

# JWST Hardware Progress

JWST remains on track for an October 2018 launch within its replan budget guidelines

29

July 2014: ● Secondary Mirror Support deployment successfully tested.  
2015: ● Engineering sunshield successfully deployed at Northrop (CA).

# Telescope Pathfinder – Risk Reduction

**JWST Pathfinder is a partial telescope that is intended to reduce the implementation risk of the assembly, integration, and cryogenic optical test of the JWST optical assembly**

# Much progress has been made in OTE integration

Where we were at last month's call

Current: all 18 PMSAs installed, liquid-shim-cured, & metrologized. Alignments meet specifications, and actuator motions verified

*Big milestone!*

8 February 2016 JWST Monthly Telecon 8

JWST lifetime: Requirement: 5 yrs; Goal: 10 yrs; Propellant: 14 yrs.

NASA team-work to take JWST mirror covers off!

JWST being tilted into the right position

Webb mirrors finally mounted and ready!

JWST stowed for further instrument mounting

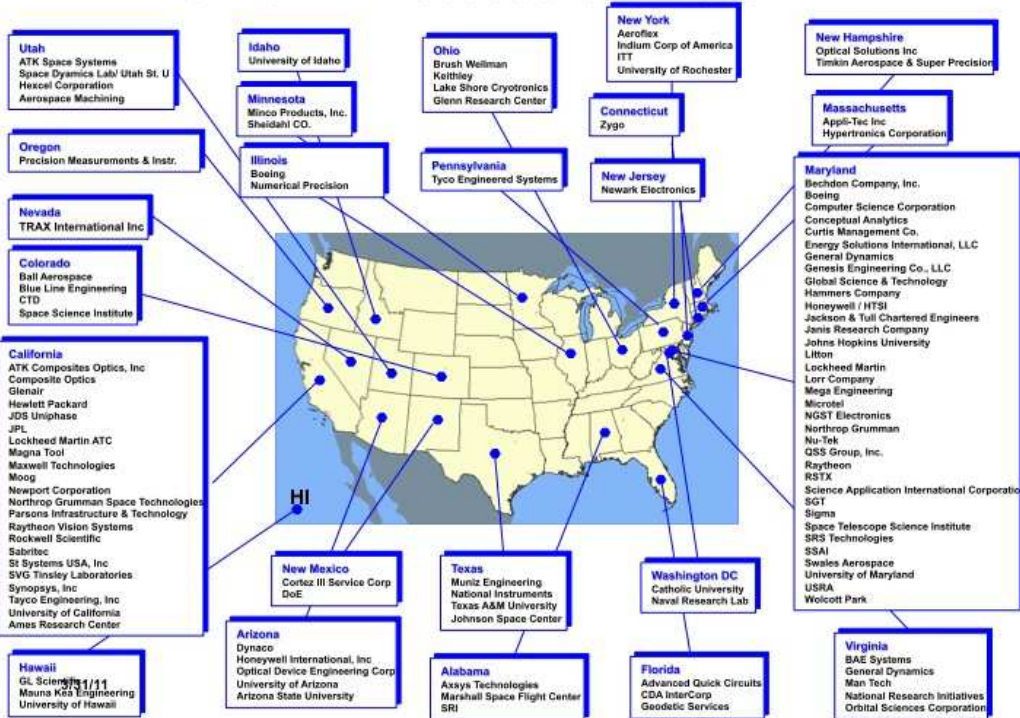

# All Instruments Integrated

# JWST: A Product of the Nation

## European Consortium Who & Where

- JWST hardware made in 27 US States:  $\approx 99.5\%$  of launch-mass finished.
- Ariane V Launch & NIRSpec provided by ESA; & MIRI by ESA & JPL.
- JWST Fine Guider Sensor + NIRISS provided by Canadian Space Agency.
- JWST NIRCам made by UofA and Lockheed.

## (2) WFC3: Hubble's new Panchromatic High-Throughput Camera

HST WFC3 and its **IR channel**: a critical pathfinder for JWST science.

## (2) Hubble WFC3: Measuring Galaxy Assembly and SMBH Growth?

10 filters with Hubble WFC3 & ACS reaching  $AB=26.5-27.0$  mag over  $40$  arcmin<sup>2</sup> with  $0.07-0.15''$  images from  $0.2-1.7\mu\text{m}$  (UVUBVizYJH).

JWST adds  $0.05-0.2''$  FWHM imaging to  $AB \simeq 31.5$  mag (1 FF) at  $1-5\mu\text{m}$ , with  $0.2-1.2''$  images at  $5-29\mu\text{m}$ , tracing young+old stars & dust.

# Black Hole growth — Waves that happen in Nature: 1) Sounds Waves:

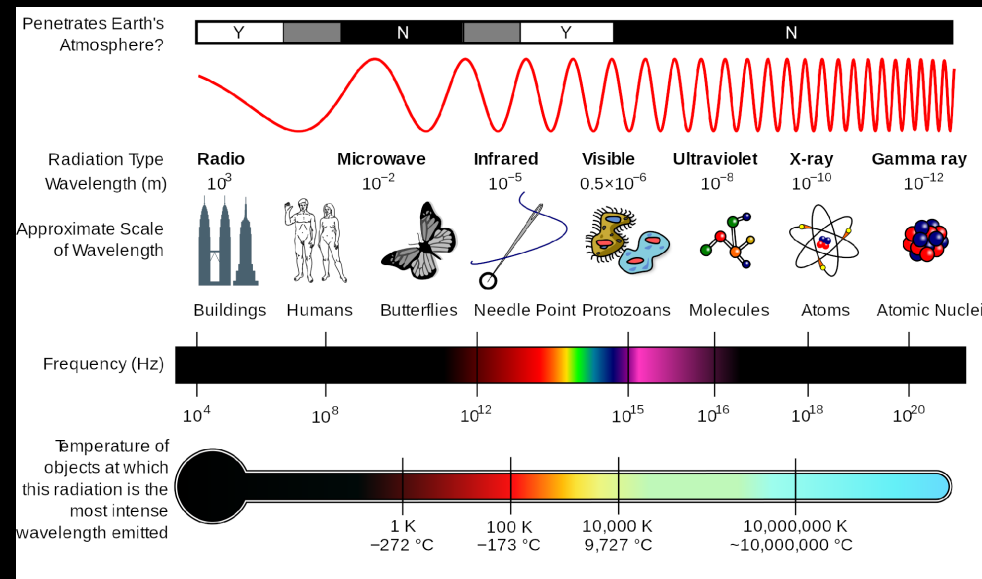

In solids: Earthquakes

In liquids: Surf!

In gasses: Sound

## 2) Electromagnetic Waves

## 3) In space-time: Gravity Waves

Sept. 2015: LIGO added Gravity Waves as a new way to observe Nature!

(1) LIGO first observed Gravitational Waves on Sept. 14, 2015.

(2) These were caused by two merging ( $29+36 M_{\odot}$ ) black holes about 1 Gyr ago!

●  $E=Mc^2$ :  $3 M_{\odot}$  was converted to energy in a fraction of a second!

Ordinary massive stars ( $10\text{--}30 M_{\odot}$ ) leave modest black holes ( $\sim 3\text{--}10 M_{\odot}$ ).

## Conclusion 1: Most low-mass black holes today are small, slow eaters:

- 29–36  $M_{\odot}$  blackholes may be leftover from First Stars (first 500 Myr).
- Likely too massive to be leftover from ordinary Supernova explosions, ...
- How come only now seen merging by LIGO (12.5 Byr after BB)?
- They were likely not fast & efficient eaters, but slow and messy ...

# Elliptical galaxy M87 with Active Galactic Nucleus (AGN) and relativistic jet:

The danger of having Quasar-like devices too close to home ...  
They are **EXTREMELY** bright sources if viewed "down-the-pipe".  
 $\sim 0.5\%$  of the baryonic mass, but produce most of the photons!

**Figure 15.** Averages of the three fiducial images of M87 for each of the four observed days after restoring each to an equivalent resolution, as in Figure 14. The indicated beam is  $20 \mu\text{as}$  (i.e., that of DIFMAP, which is always the largest of the three individual beams).

2019 discovery of Black Hole Shadow in M87 by Event Horizon Telescope:  
M87 at 55 Mlyr distance has a black hole mass of  $\sim 6.5 \times 10^9 M_{\odot}$ !

Centaurus A  
NGC 5128  
HST WFC3/UVIS

F487N H $\beta$   
F502N [O III]  
F547M y  
F657N H $\alpha$ + [N II]  
F673N [S II]  
F814W I

3000 light-years  
1400 parsecs

56''

Blue=X-rays; White=Optical; Orange=Radio

- Quasars: Centers of galaxies with feeding supermassive blackholes:

- Hubble IR-images of the most luminous Quasar known in the universe.
- Seen at redshift 6.42 (universe  $7.42\times$  smaller than today), 900 Myr old!
- Contains  $10^{14}$  solar luminosities within a region as small as Pluto's orbit!
- A feeding monster blackhole ( $>3\times 10^9$  solar mass) 900 Myr after BB!

## Conclusion 2: Supermassive black holes started early & were very rapid eaters:

- Massive galaxies today contain a super-massive blackhole, no exceptions!
- Masses  $\sim 3 \times 10^9$  solar, leftover from the First Stars (first 500 Myr)?
- Must have fed enormously rapidly in the first 1 Byr after the Big Bang.
- Were eating *cat*-astrophically (and secretly) until they ran out of food ...
- JWST can image the First Quasars to  $z \gtrsim 10$  (*if* we can find them).

Will this ever happen to our own Galaxy?

YES! Hubble showed no lateral motion of Andromeda:

Approaches at  $-110$  km/s.

Hence, Andromeda will merge with Milky Way!

The two blackholes ( $10^6$ – $10^7$  suns) will also merge!

Not to worry: only 4–5 Byr from today!

Illustration Sequence of the Milky Way  
and Andromeda Galaxy Colliding

### (3) How will JWST Observe First Light and Reionization?

- Detailed cosmological models (V. Bromm) suggest that massive “Pop III” stars ( $\gtrsim 100 M_{sun}$ ) started to reionize the universe at  $z \lesssim 10-30$  (0.1–0.5 Gyr; “First Light”).
- This should be visible to JWST as the first Pop III stars or surrounding (Pop II.5) star clusters, and perhaps their extremely luminous supernovae at  $z \simeq 10 \rightarrow 30$ .

We must make sure that we theoretically understand the likely Pop III mass-range, their IMF, their duplicity and clustering properties, their SN-rates, etc., before JWST flies, so we know what to look for.

### 3) How will Webb measure First Light: What to expect in (Ultra)Deep Fields?

● Can't beat redshift: to see First Light, must observe near-mid IR.

⇒ This is why JWST needs NIRCcam at 0.8–5  $\mu\text{m}$  and MIRI at 5–28  $\mu\text{m}$ .

The HST-unique part for JWST:

Panchromatic 13 filter HUDF: UV-Blue emphasized.

592<sup>h</sup> HUDF weighted log-log: FuvNuvUBVilzYJWH, AB  $\lesssim 28-31$  ( $\gtrsim 2$  nJy).

$\circ$   $z=7-8$ ,  $\circ$   $z=9$ ,  $\bigcirc$   $z=10-12$ . Panchromatic 13 filter HUDF: Red-IR emphasized.

$592^h$  HUDF weighted log-log: FuvNuvUBViIzYJWH, AB  $\lesssim 31$  ( $\gtrsim 2$  nJy).

Panchromatic 13 filter HUDF:

False-color "Bolometric" or  $\chi^2$  image.

841 orbits = 592<sup>h</sup> HUDF: AB  $\lesssim$  31 mag; Objects affect  $\sim 45\%$  of pixels!!

HST Frontier Field A2744: JWST needs lensing to see First Light at  $z \gtrsim 11-15$ .

Conclusion: JWST First Light strategy must consider three aspects:

(1) The catastrophic drop in the object density at  $z \gtrsim 8$  ( $\lesssim 0.5$  Gyr).

(2) Cannot-see-the-forest-for-the-trees effect [“Natural Confusion” limit]:  
Background objects blend into foreground because of their own diameter.

(3) House-of-mirrors effect [“Gravitational Confusion”]:

- JWST needs to find most First Light objects at  $z \gtrsim 10$ –15 through the best cosmic lenses (this will make the images even more crowded):
- Lensing is needed to see what Einstein thought was impossible to observe!

## (4) Future: Next generation 20–40 m ground-based telescopes and ATLAST

True relative size: Hubble, James Webb, & Giant Magellan Telescope

(1973~2020+); (1996~2031);

(2000~2050<sup>+</sup>).

- JWST has superbly dark L2-sky & SB-sensitivity, and stable PSF.
- GMT has 4× higher Res (AO), high-Res spectra, long-term time-domain.

(4) Future: Next generation 20–40 m ground-based telescopes and ATLAST  
True relative size: Hubble, James Webb, and ATLAST ...

(1973~2020+);

(1996~2031);

(2020~2050+?).

## (4) Future: How can we knock it out of the ball-park in the next 30 years?

Each of GMT and ATLAST facility nearly fills the whole Yankee ballpark ...

- New paradigm: They are too large for an individual university to take on.
- Universities need to collaborate nation-wide to make this happen.

## (5) Summary and Conclusions

(1) HST set stage to measure galaxy assembly in the last 12.7-13.0 Gyrs.

(2) JWST passed Preliminary & Critical Design Reviews in 2008 & 2010.

Management replan in 2010-2011. No technical showstoppers thus far:

- More than 99% of JWST H/W built or in fab, & meets/exceeds specs.

(3) JWST is designed to map the epochs of First Light, Reionization, and Galaxy Assembly & SMBH-growth in detail. JWST will determine:

- Formation and evolution of the first star-clusters after 0.2 Gyr.

- How dwarf galaxies formed and reionized the Universe after 1 Gyr.

(4) JWST will have a major impact on astrophysics this decade:

- IR sequel to HST starting 2021: Training next generation researchers.

- JWST will define the next frontier to explore: the Dark Ages at  $z \gtrsim 20$ .

What the Scientists See:

What the Project Manager Sees:

The Happy Balance

Found at GP9A.CX

Any (space) mission is a balance between what science demands, what technology can do, and what budget & schedule allows ... (courtesy Prof. R. Ellis).

- (6) Update of JWST programmatic as of 2019

## Northrop Grumman Expertise in Space Deployable Systems

- Over 45 years experience in the design, manufacture, integration, verification and flight operation of spacecraft deployables
- 100% mission success rate, comprising over 640 deployable systems with over 2000 elements

## Baseline "Cup Down" Tower Configuration at JSC (Before)

## JSC "Cup Up" Test Configuration (New Proposal)

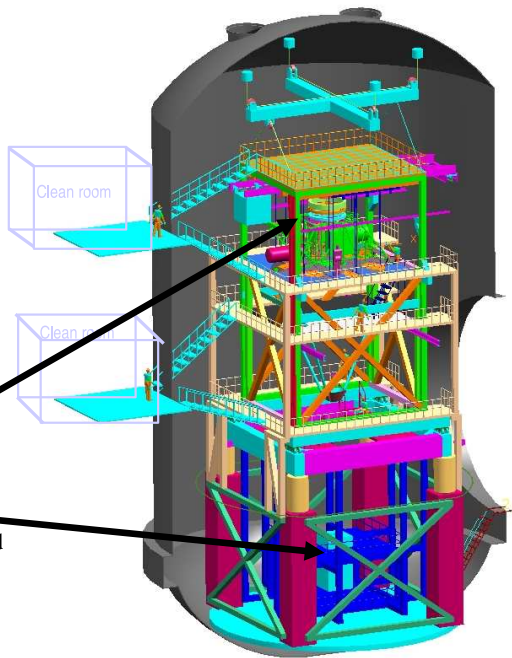

Most recent Tower Design shows an Inner Optical Tower supported by a Outer structure with Vibration Isolation at the midplane. Everything shown is in the 20K region (helium connections, etc. not shown) except clean room and lift fixture.

Current plan calls for 33KW cooldown capability, 12 KW steady state, 300-500mW N2 cooling

JSC currently has 7 KW He capability

Current plan includes 10 trucks of LN2/day during cooldown

Interferometers, Sources, Null Lens and Alignment Equipment Are in Upper and Lower Pressure Tight Enclosure Inside of Shroud

No Metrology Tower and Associated Cooling H/W.  
External Metrology  
Two basic test options:  
1. Use isolators, remove drift through fast active control + freeze test equipment jitter  
2. Eliminate vibration isolators (but use soft dampeners) to avoid drift, freeze out jitter  
Builds on successful AMSD heritage of freezing and averaging jitter, testing through windows.

Possible payload "floor" to separate ambient pressure and temperature.

Drawing care of ITT

Page 6

JWST underwent several significant replans and risk-reduction schemes:

- $\lesssim 2003$ : Reduction from 8.0 to 7.0 to 6.5 meter. Ariane-V launch vehicle.
- 2005: Eliminate costly 0.7-1.0  $\mu\text{m}$  performance specs (kept 2.0  $\mu\text{m}$ ).
- 2005: Simplification of thermal vacuum tests: cup-up, not cup-down.
- 2006: All critical technology at Technical Readiness Level 6 (TRL-6).
- 2008: Passes Mission Preliminary Design & Non-advocate Reviews.
- 2010, 2011: Passes Mission Critical Design Review: Replan Int. & Testing.
- 2017-2018: Replan final Integration & Testing  $\Rightarrow$  March 2021 launch.

# Fiscal Year 2019 JWST HQ Milestones

Month	Milestone	Comment
Oct-18	1 Conduct Wavefront Sensing rehearsal #2 at the Missions Operations Center (MOC)	<u>Completed 10/6/18</u>
	2 Stow the sunshield into launch position following repairs of the membrane covers	<u>Completed 9/28/18</u>
	3 Spacecraft Element (SCE) ready for resumption of environmental testing following MCA repairs	<u>Completed 10/19/18</u>
Nov-18	4 Complete Spacecraft Element Acoustic Test	<u>Completed 10/28/18</u>
	5 Deliver Observatory Science and Operations software build	<u>Completed 10/19/18</u>
Dec-18	6 Conduct Science Operations rehearsal #4 at the MOC	<u>Completed 12/21/18</u>
	7 Begin Spacecraft Element vibration testing	<u>Completed 11/15/18</u>
	8 Complete the validation of science payload software	<u>Completed 10/27/18</u>
Jan-19	9 Conduct a SCE Comprehensive System Test in preparation for thermal vacuum testing	<u>Completed 9/26/18</u>
Feb-19	10 Deliver final results for SCE environmental testing	Complete 4/5/2019
	11 Conduct Early Commissioning Exercise #2 at the MOC	Completed 3/6/2019 (Government shutdown delay)
Mar-19	12 Begin Spacecraft Element thermal vacuum test	Completed 4/7/19
	13 Deliver the flight version of launch vehicle coupled loads analysis #2 Observatory model	Completed 5/6/19
Apr-19	14 Open thermal vacuum chamber door following testing	Completed 5/19/19
	15 Conduct Wavefront Sensing rehearsal #3 at the MOC	<u>Completed 4/12/19</u>
May-19	- NONE	
Jun-19	16 Complete Spacecraft Element post-launch environmental testing deployment	replanned to follow science payload installation (FY20)
	17 Complete the secondary mirror structure deployment driven by the Spacecraft Element	Completed 7/13/19
Jul-19	18 Received updated Cycle 1 proposals from the Guaranteed Time Observers	<u>Completed 6/25/19</u>
	19 Conduct Science Operations rehearsal #5 at the MOC	Completed 7/12/19
Aug-19	20 Complete Spacecraft Element post-launch environments and thermal vacuum testing folding	replanned to follow science payload installation (FY20)
	21 Observatory System Integration Review (SIR)	Completed 7/25/2019 (Part 1), 10/19 (Part 2)
Sep-19	22 Install science payload onto the Spacecraft Element	<u>Completed 8/23/19</u>
	23 Deliver the flight version of launch vehicle coupled loads analysis #2 results and detailed assessment	replanned to follow science payload installation (FY20)
	24 Spacecraft Element Integration complete	<u>Completed 6/29/19</u>
	25 Conduct Contingency Planning rehearsal #3 at the MOC	Completed 9/27/19

Blue font(underline) denotes milestones accomplished ahead of schedule, orange font denotes milestones accomplished late.

191021 JWST Monthly Telecon 2

Project back on track in Fall 2018/early 2019 to launch in March 2021.

# Fiscal Year 2020 JWST HQ Milestones

Month	Milestone	FY2019 Deferral	Comment
Oct-19	1 Spacecraft Element level post-environment deployments complete	•	
Nov-19	2 Flight Software build 3.4 delivered		
	3 Data Management Subsystem build 7.4 delivered		
Dec-19	4 Replacement traveling wave tunable amplifiers (TWTAs) delivered		
Jan-20	5 Spacecraft Element level Sunshield post-environment folding complete	•	
	6 Deployable Tower Assembly deployment complete		
Feb-20	7 Flight coupled loads analysis #2 delivered	•	
	8 Command/Telemetry Processor (CTP) replacement delivered		
Mar-20	9 Replacement CTP & TWTA installed into Spacecraft		
	10 Conduct fourth early commissioning exercise		
Apr-20	11 Comprehensive System Test #4 readiness review complete		
	12 Deliver Science and Operations Center release 2.1		
May-20	13 Full Observatory level acoustics testing complete		
Jun-20	14 Full Observatory level vibration testing complete		
Jul-20	15 Telescope primary mirror wing deployment complete		
Aug-20	16 Final Sunshield membrane tensioning complete		
	17 Evaluation of Cycle 1 General Observers proposals (by Time Allocation Committee)		
Sep-20	18 Third launch readiness exercise conducted		

Blue font (underline) denotes milestones accomplished ahead of schedule, orange font denotes milestones accomplished late.

Future Project tasks to be done in FY20.

# Milestone Performance

- Since the September 2011 replan JWST reports high-level milestones monthly to numerous stakeholders

	Total Milestones	Total Milestones Completed	Number Completed Early	Number Completed Late	Deferred to Next Year	Deferred more than one quarter
FY2011	21	21	6	3	0	0
FY2012	37	34	16	2	3	3
FY2013	41	38	20	5	3	2
FY2014❖	36	23	10	8	11	10
FY2015	48	44	22	12	4	3
FY2016	45	39	25	7	6	2
FY2017	38	32	12	13	8	5
FY2018	31	18	7	2	13	13
FY2019	25	22	10	10	3	2
FY2020	18	0	0	0	0	0

❖ Milestone accounting in FY2014 was complicated by the government shutdown and multicomponent milestones

6

191021 JWST Monthly Telecon 7

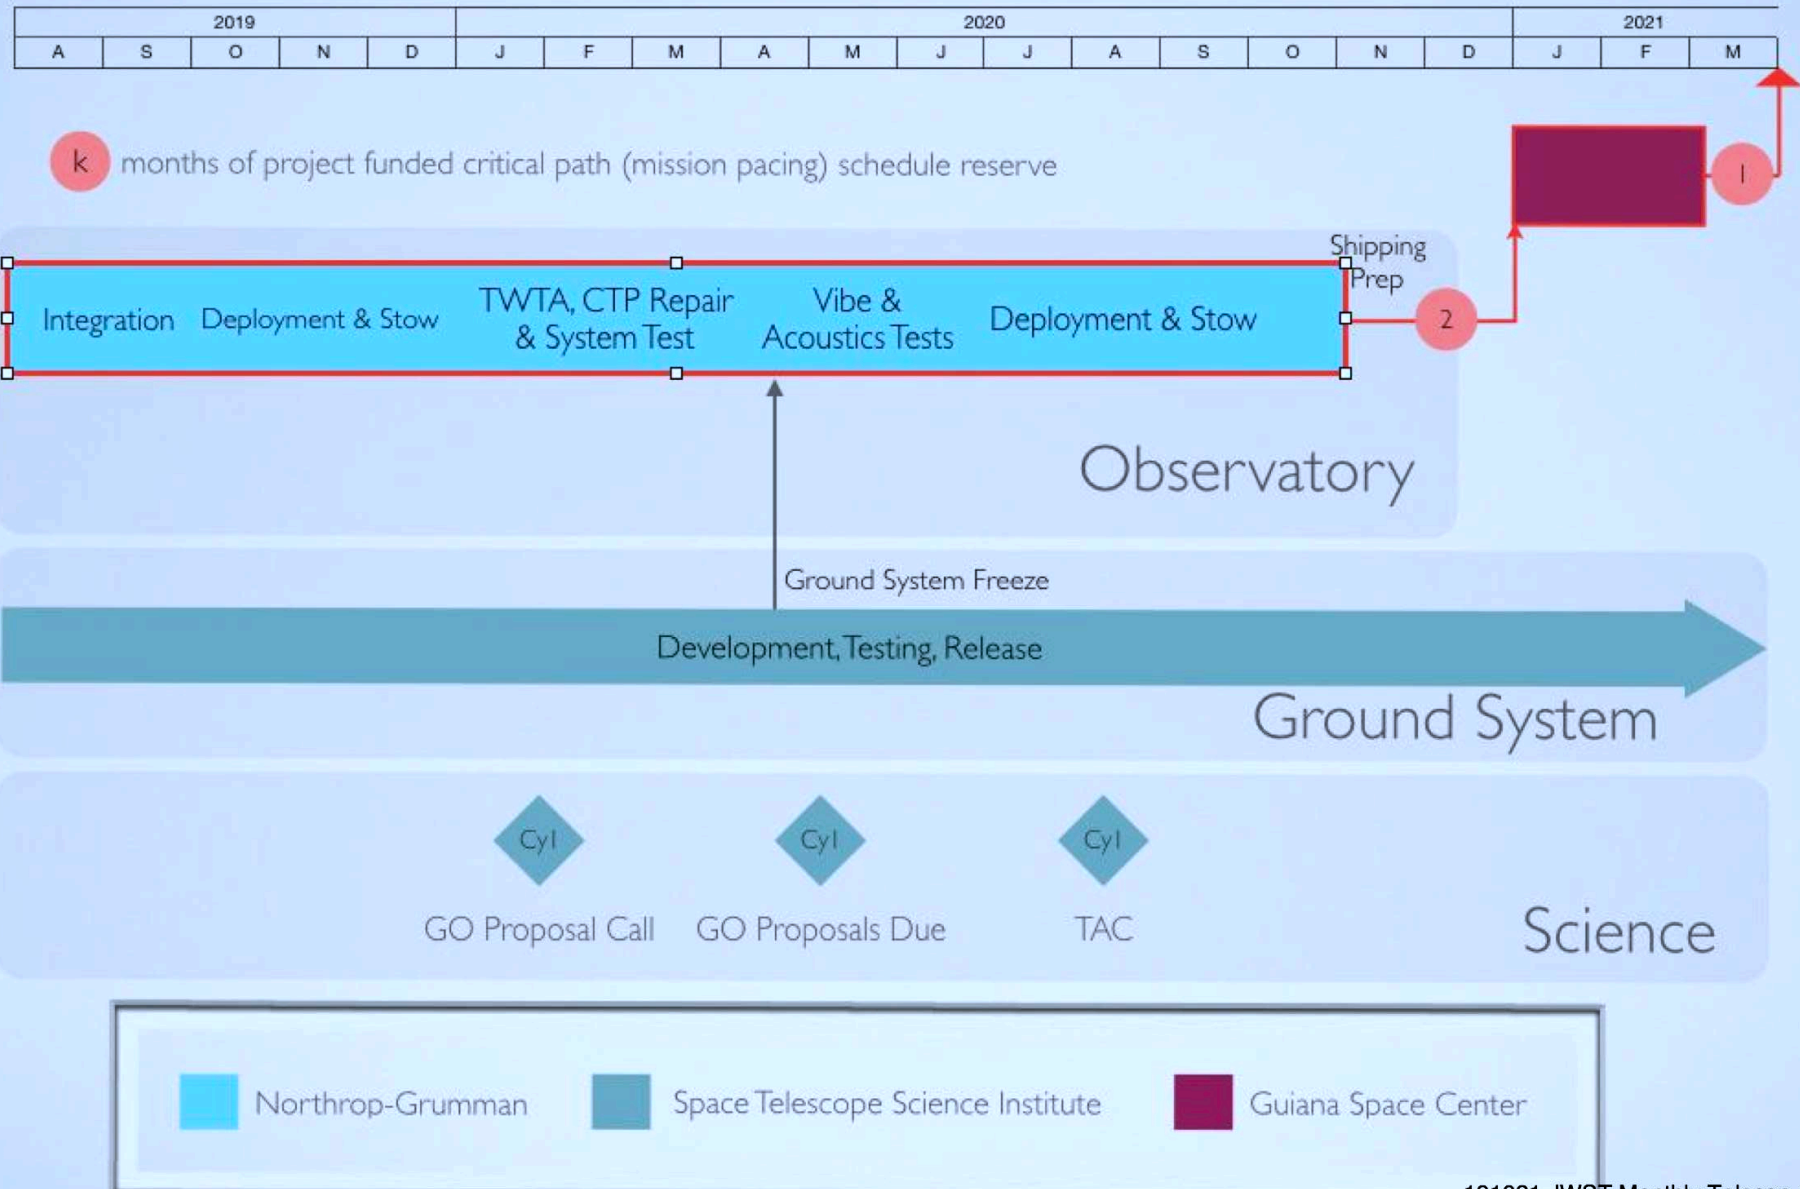

FY14: 8 milestones late by 1 month due to Oct 13 Government shutdown.

FY15: Most “Lates” not on critical path.

FY17: Lates started to outnumber Early’s ⇒ Replan Integration & Testing.

# SIMPLIFIED SCHEDULE

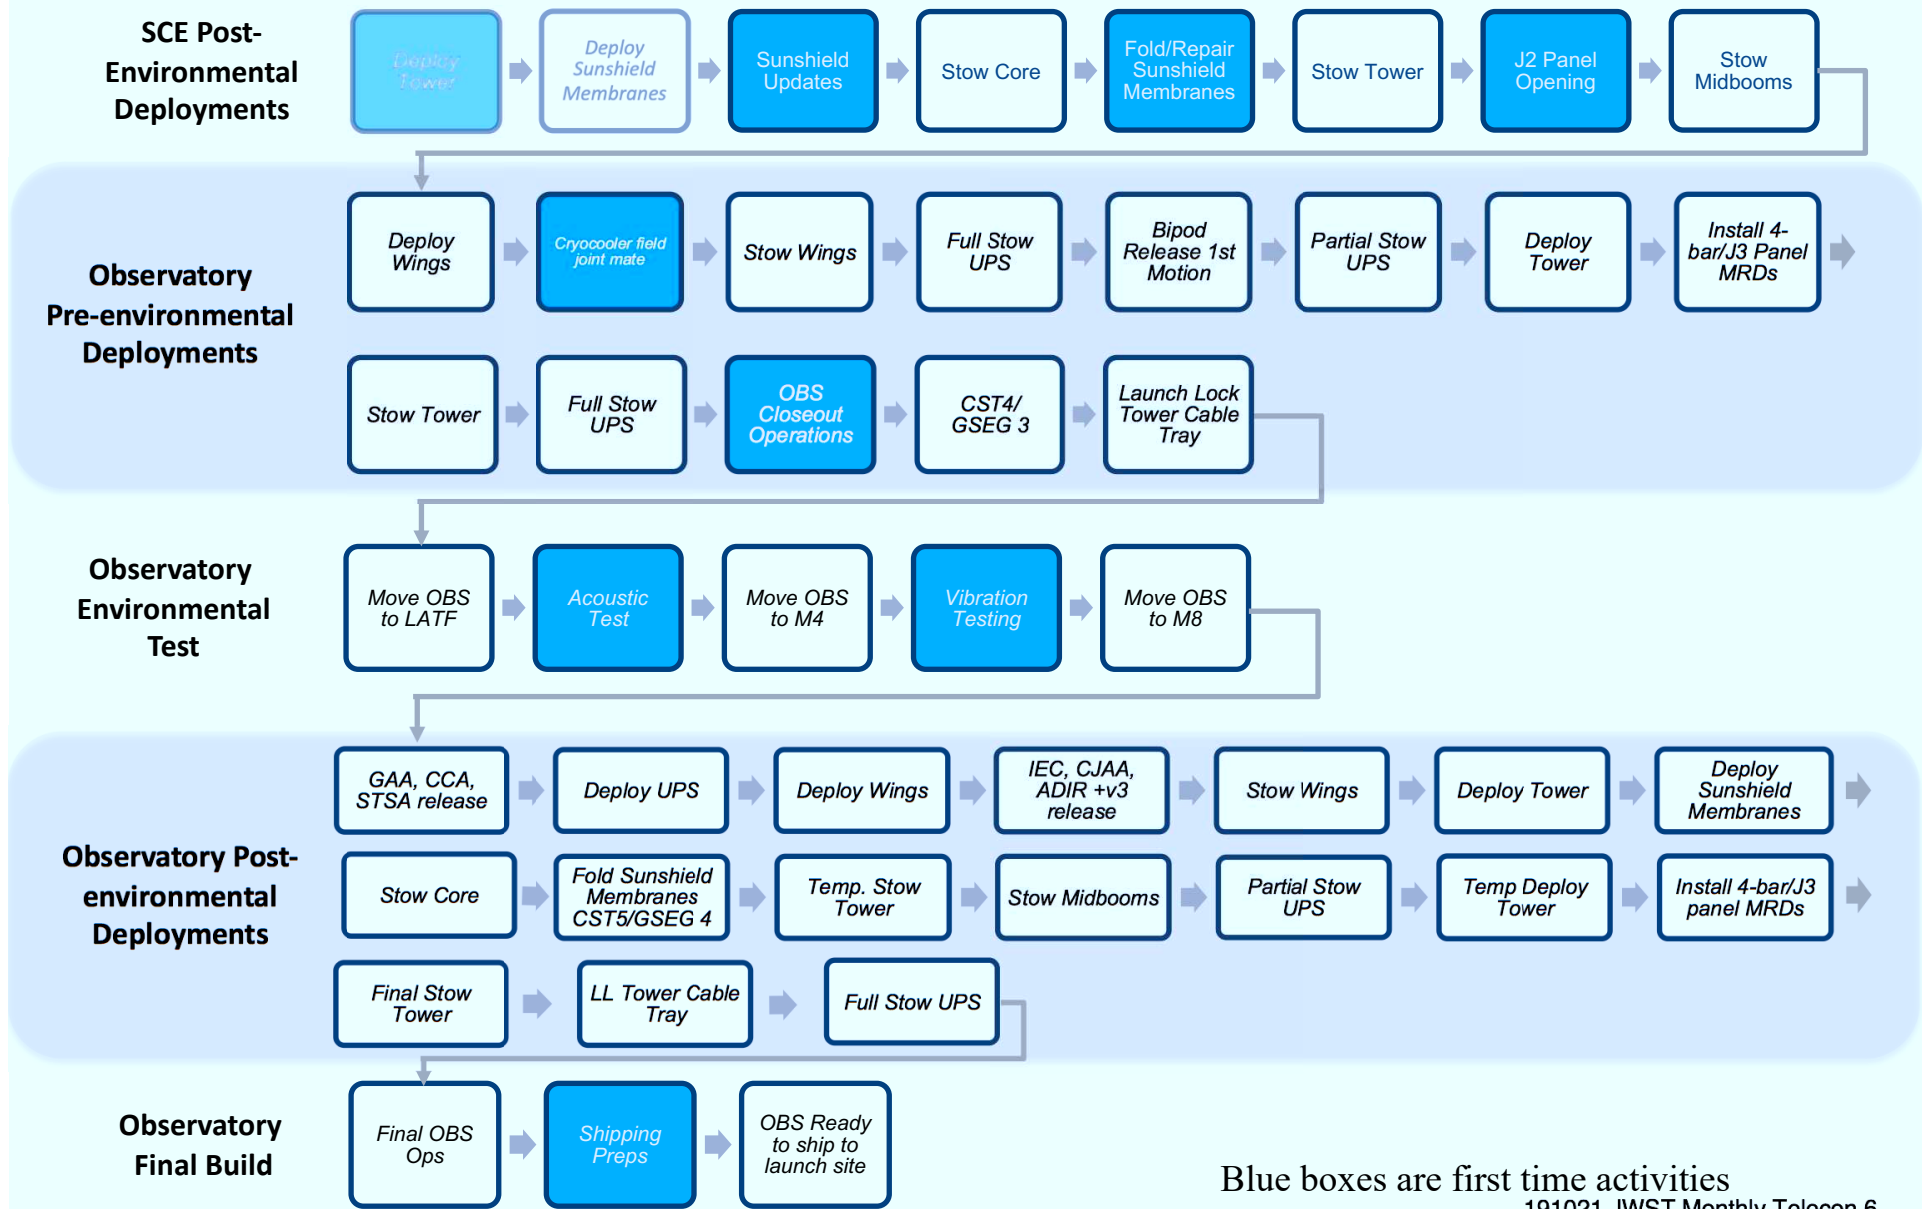

191021 JWST Monthly Telecon 4

- Path forward to Launch (NOW: March 2021):  $\lesssim 3$  mos schedule reserve.
- Sunshield and Spacecraft now on critical path (at Northrop).

# Remaining I&T Activities

Blue boxes are first time activities  
191021 JWST Monthly Telecon 6

Flowchart of future Project tasks for FY20.

Blue = First-time System test (but done before at the sub-system level).

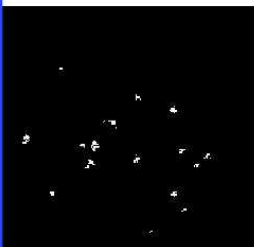

# Funded Schedule Reserve

Project back on track in Fall 2018/early 2019 to launch in March 2021.

**First light  
NIRCam**

1. Segment Image Capture

After Step 1

**Initial Capture**

18 individual 1.6-m diameter aberrated sub-telescope images  
 PM segments: < 1 mm, < 2 arcmin tilt  
 SM: < 3 mm, < 5 arcmin tilt

**Final Condition**

PM segments:  
 < 100 μm,  
 < 2 arcsec tilt  
 SM: < 3 mm,  
 < 5 arcmin tilt

2. Coarse Alignment  
 Secondary mirror aligned  
 Primary RoC adjusted

After Step 2

Primary Mirror segments:  
 < 1 mm, < 10 arcsec tilt  
 Secondary Mirror :  
 < 3 mm, < 5 arcmin tilt

WFE < 200 μm (rms)

3. Coarse Phasing - Fine Guiding (PMSA piston)

After Step 3

WFE: < 250 μm rms

WFE < 1 μm (rms)

4. Fine Phasing

After Step 4

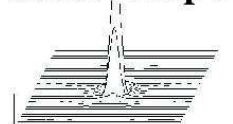

WFE: < 5 μm (rms)

WFE < 110 nm (rms)

5. Image-Based Wavefront Monitoring

After Step 5

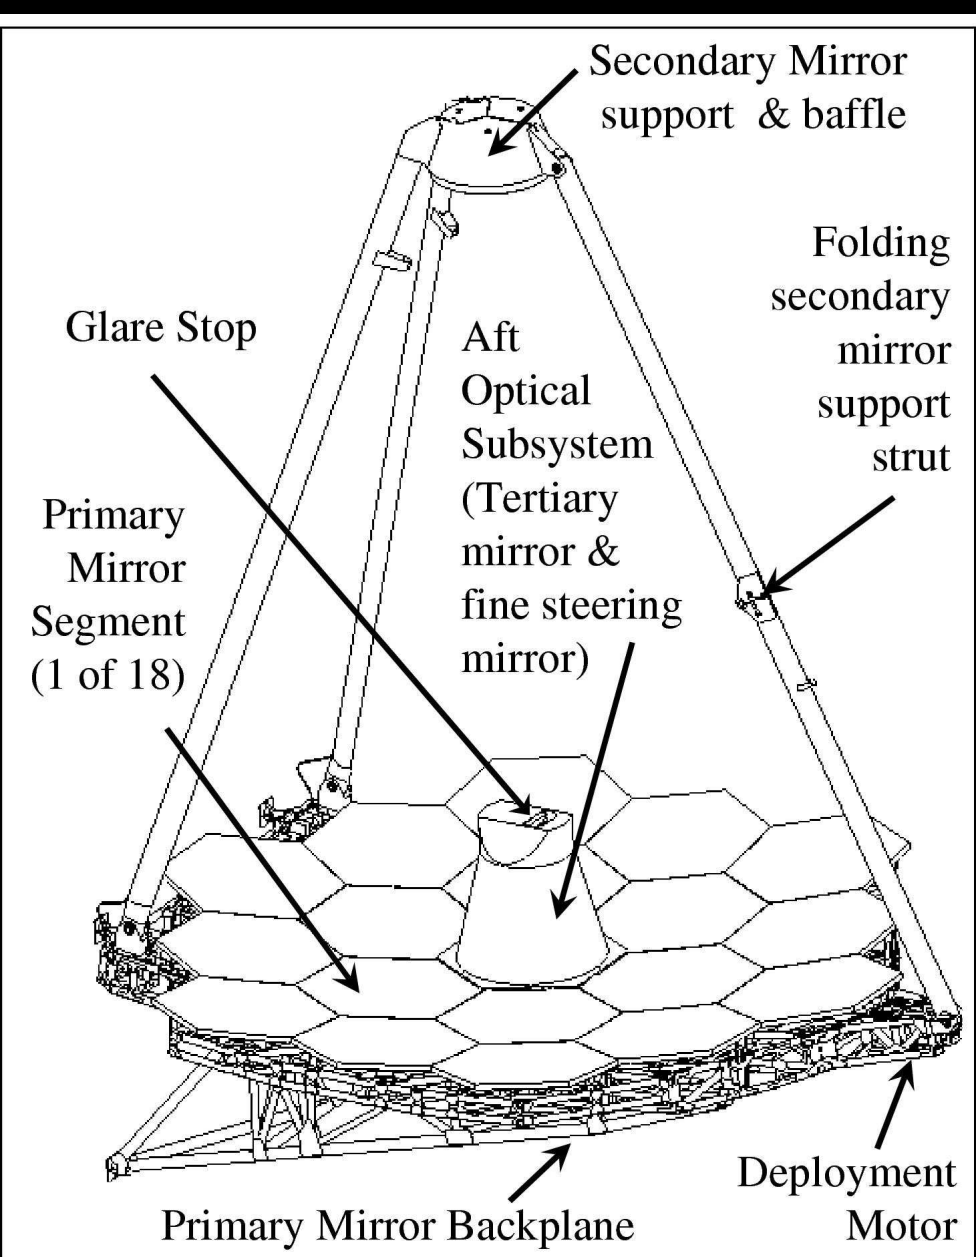

WFE: < 150 nm (rms)

WFE < 110 nm (rms)

JWST's Wave Front Sensing and Control is similar to the Keck telescope.

In L2, need WFS updates every 10 days depending on scheduling/illumination.

Wave-Front Sensing tested hands-off at 40 K in 1-G at JSC in 2015–2017.  
Ball 1/6 scale-model for WFS: produces diffraction-limited  $2.0 \mu\text{m}$  images.

JWST can observe North/South Ecliptic pole targets continuously:

- 1000-hr JWST projects swap back/forth between NEP/SEP targets.
- JWST gets the very best reaction wheels (Rockwell Collins; Heidelberg).

- What instruments will JWST have?

All JWST instruments can in principle be used in parallel observing mode:

- Currently only being implemented for parallel *calibrations*.

## (7) How can JWST measure Star-Formation and Earth-like exoplanets?

NGC 3603: Young star-cluster triggering star-birth in "Pillars of Creation"

Pillar and Stellar Jet in the Carina Nebula  
HST WFC3/UVIS

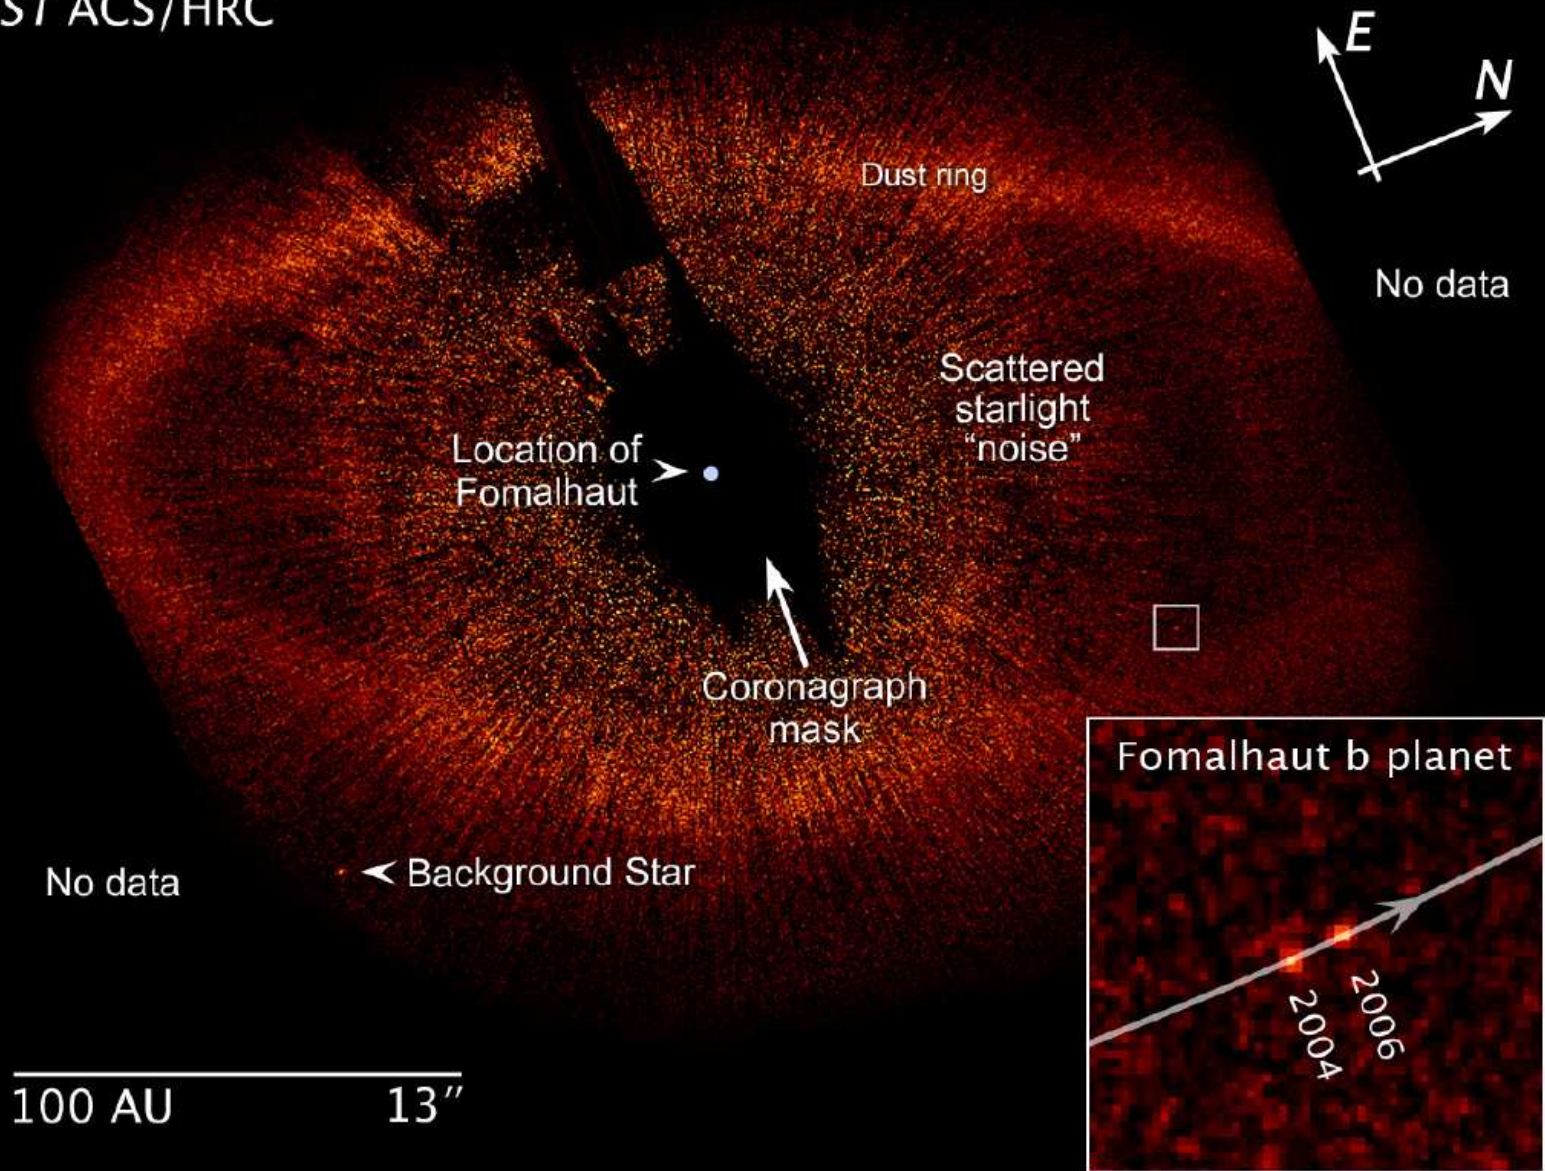

HST WFC3/IR

Fomalhaut  
HST ACS/HRC

HST/ACS Coronagraph imaging of planetary debris disk around Fomalhaut:  
First direct imaging of a moving planet forming around a nearby star!

JWST can find such planets much closer in for much farther stars.

## Exoplanet HR 8799 System

HST/NICMOS

HST/NICMOS with additional processing

HR 8799 planet orbits

Relative size of  
Neptune's orbit

NASA, ESA, and R. Soummer (STScI)

STScI-PRC11-29

HST/NICMOS imaging of planetary system around the (carefully subtracted) star HR 8799: Direct imaging of planets around a nearby star.

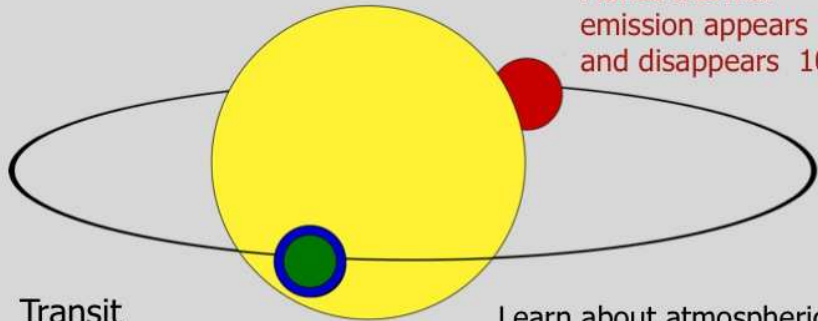

Press release: <http://hubblesite.org/newscenter/archive/releases/2011/29/>

**JWST can find such planets much closer in for much farther-away stars.**

## Schematic of Transit and Eclipse Science

Seager & Deming (2010, ARAA, 48, 631)

**Transit**

Measure size of planet  $10^{-2}$

See starlight transmitted through planet atmosphere  $10^{-4}$

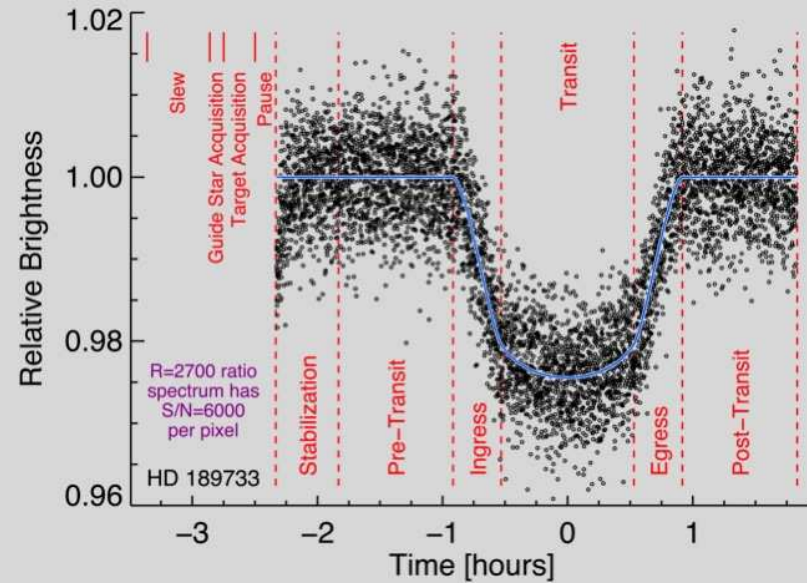

**Eclipse**

Planet thermal emission appears and disappears  $10^{-3}$

Learn about atmospheric circulation from thermal phase curves

6

## Timeline of a Transit Observation

13

JWST can do very precise photometry of transiting Earth-like exoplanets.

JWST IR spectra can find water and CO<sub>2</sub> in (super-)Earth-like exoplanets.

# Transit Spectrum of Habitable "Ocean Planet"

JWST IR spectra can find water and CO<sub>2</sub> in transiting Earth-like exoplanets.

Infrared

**30 Doradus Nebula and Star Cluster**  
*Hubble Space Telescope* ■ WFC3/UVIS/IR

NASA, ESA, F. Paresce (INAF-IASF, Italy), and the WFC3 Science Oversight Committee

STScI-PRC09-32b

30 Doradus: Giant young star-cluster in Large Magellanic Cloud (150,000 ly), triggering birth of Sun-like stars (and surrounding debris disks).

## (8) What do our Astrophysics College Graduates do?

### Future Careers at NASA:

- Over the last 25 years, (ASU) Astrophysics College Graduates typically:
- (0) Have very low unemployment ( $\lesssim$  few %).
- (1) About 30% are faculty at Universities or 4-year colleges.
- (2) About 30% are researchers at NASA or other government centers.
- (3) About 20% work in Aerospace or related industries.
- (4) About 20% are faculty at Community Colleges or Highschools.
