

How can the James Webb Space Telescope Measure First Light, Reionization, & Galaxy Assembly?

Rogier Windhorst (ASU) — JWST Interdisciplinary Scientist

Collaborators: S. Cohen, R. Jansen (ASU), C. Conselice, S. Driver (UK), & H. Yan (Carnegie)

& ASU Grad Students: N. Hathi, H. Kim, R. Ryan, A. Straughn, & K. Tamura (ASU)

Colloquium at the School of Earth & Space Exploration, ASU, Tempe, Wednesday, November 14, 2007

Outline

- (0) Introduction: Cosmic Expansion and Contents of the Universe
 - (1) What is JWST and how will it be deployed?
 - (2) What instruments and sensitivity will JWST have?
 - (3) What is, & how can JWST measure First Light & Reionization?
 - (4) What is, & how can JWST measure Galaxy Assembly?
 - (5) Predicted Galaxy Appearance for JWST at redshifts $z \simeq 1-15$
 - (6) Summary and Conclusions
 - Appendix 1: Future Studies with the Hubble Wide Field Camera 3
 - Appendix 2: What is the Lyman continuum escape fraction $f_{esc}(z)$ of dwarf galaxies?

Sponsored by NASA/JWST & HST

(0) Intro: Cosmic Expansion and Contents of the Universe

Expansion \Rightarrow redshift

$$\lambda_{obs} = \lambda_{rest} \cdot (1+z)$$

Hubble's Law:

$$D \simeq v / H_0 \simeq (c/H_0) \cdot z = R_0 \cdot z$$

Item:

Numbers inside $R_0 = (c/H_0) \simeq 13.65$ Gyr:
 $\Rightarrow t_{univ} = (211 \pm 1 !). t_{dino} [= 65 \text{ Myr}]$

Photons:

$$N_{h\nu} \sim 10^{89}$$

Baryons:

$$N_b \sim 10^{80}$$

η = Photons/Baryons

$$\eta \sim 10^9 \Rightarrow \text{He/H ratio} = 0.235$$

Energy Density:

as fraction of critical closure density (WMAP):

Baryons (atoms):

$$\Omega_b = \rho_b / \rho_{crit} \simeq 0.042$$

Dark Matter:

$$\Omega_d = \rho_d / \rho_{crit} \simeq 0.20$$

Dark Energy:

$$\Omega_\Lambda = \rho_\Lambda / \rho_{crit} \simeq 0.76$$

(Supermassive) black holes:

$$\Omega_{smbh} = \rho_{smbh} / \rho_{crit} \simeq 0.0001$$

Total

$$\Omega_{tot} = \rho_{tot} / \rho_{crit} \simeq 1.00 \pm 0.02$$

$(\rho_{crit} \simeq 10^{-29} \text{ gr/cm}^3)$

Relativistic Distance, Volume Element, and Angular Size vs. z .

Need hard-working grad students & postdocs in $\gtrsim 2013$... It'll be worth it!

James Webb Space Telescope

- (1) What is the James Webb Space Telescope (JWST)?

- A fully deployable 6.5 meter (25 m^2) segmented IR telescope for imaging and spectroscopy from 0.6 to $28 \mu\text{m}$, to be launched by NASA $\gtrsim 2013$. It has a nested array of sun-shields to keep its ambient temperature at 35-45 K, allowing faint imaging ($\text{AB} \lesssim 31.5$) and spectroscopy ($\text{AB} \lesssim 29 \text{ mag}$).

Life size model of JWST: displayed at the Jan. 2007 AAS mtg in Seattle.

Life-sized model of JWST, used to test its sun-shield.

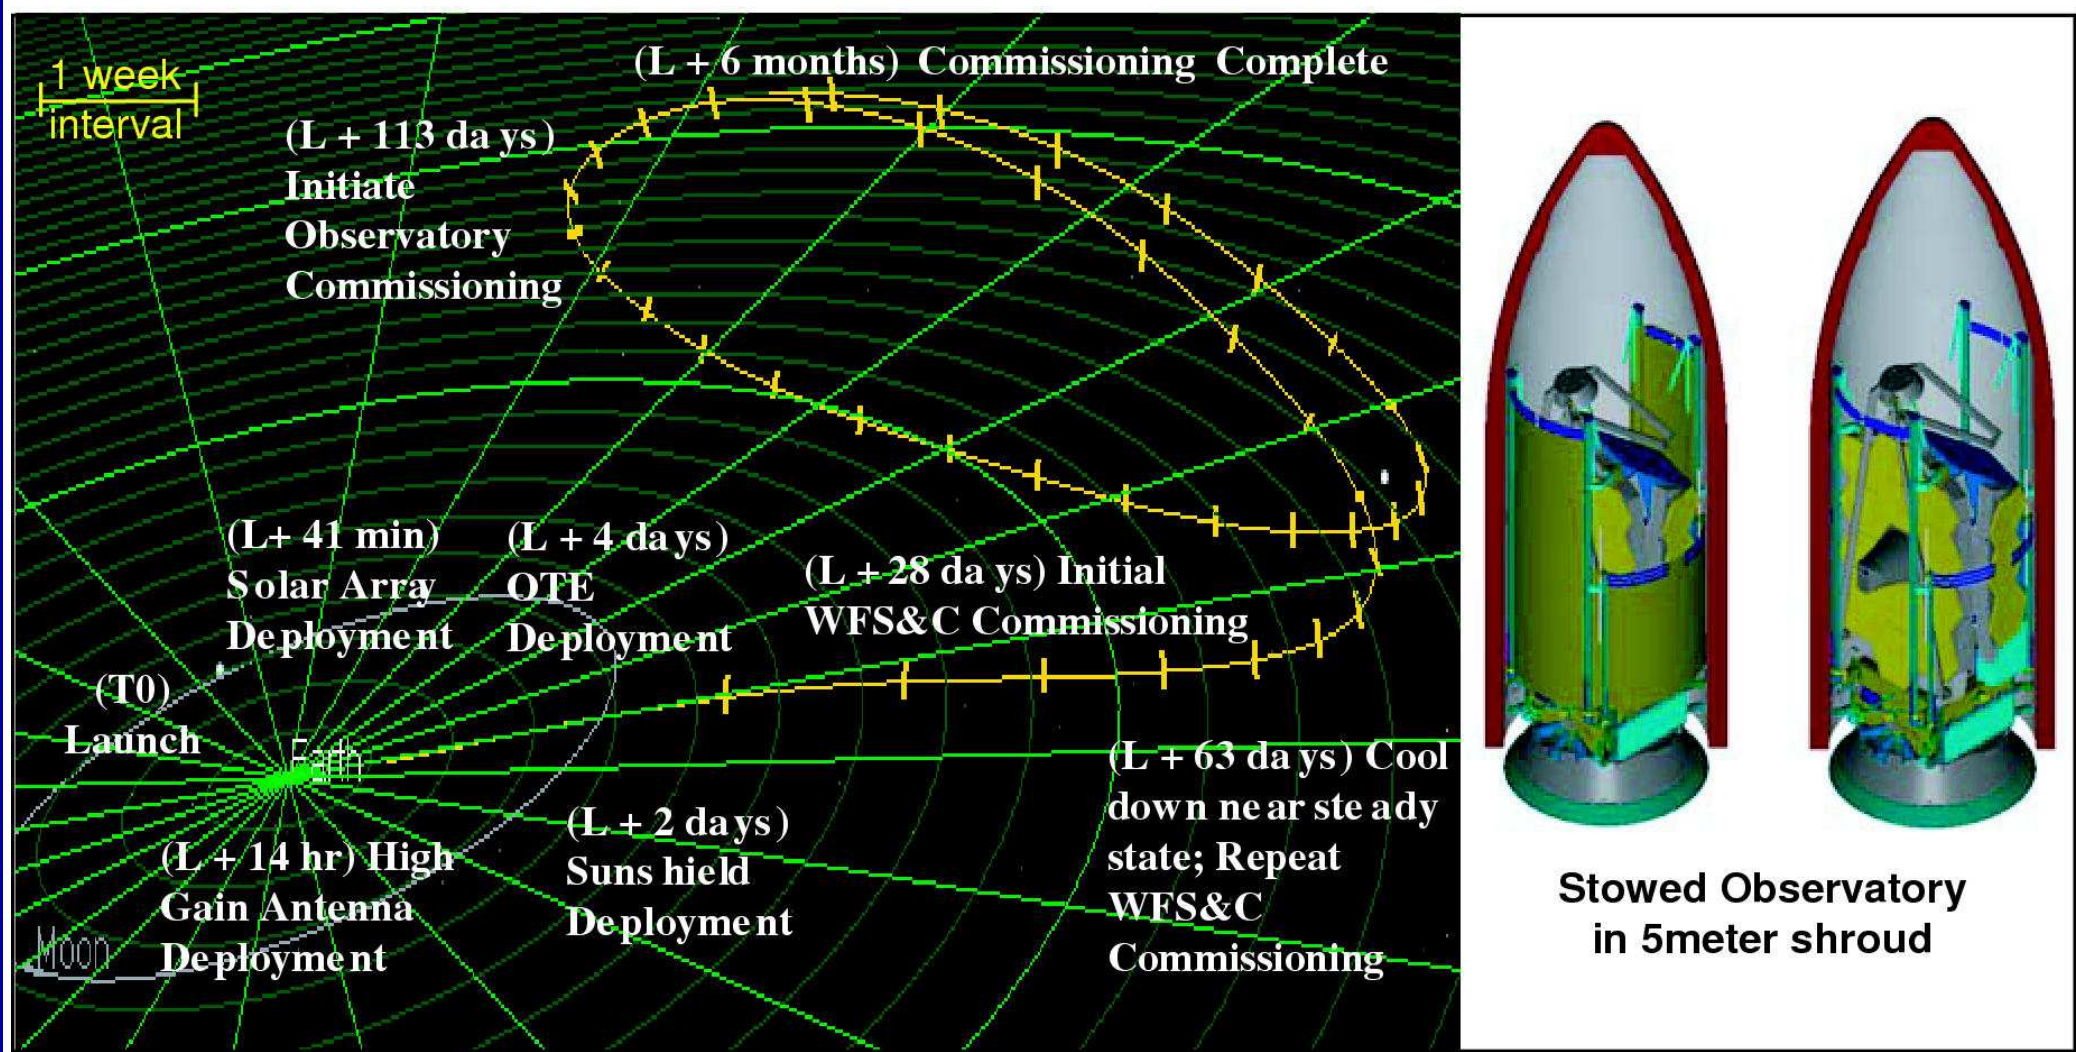

Life-sized model of JWST, at NASA/GSFC Friday afternoon after 5 pm ...

JWST on the Capitol Mall, May 2007 ...

- (1) How will JWST travel to its L2 orbit?

After launch in June 2013 with an Ariane-V vehicle, JWST will orbit around the the Earth–Sun Lagrange point L2. From there, JWST can cover the whole sky in segments that move along in RA with the Earth, have an observing efficiency $\gtrsim 70\%$, and send data back to Earth every day.

- (1) How will JWST be automatically deployed?

During its several month journey to L2, JWST will be automatically deployed in phases, its instruments will be tested and calibrated, and it will then be inserted into an L2 halo orbit.

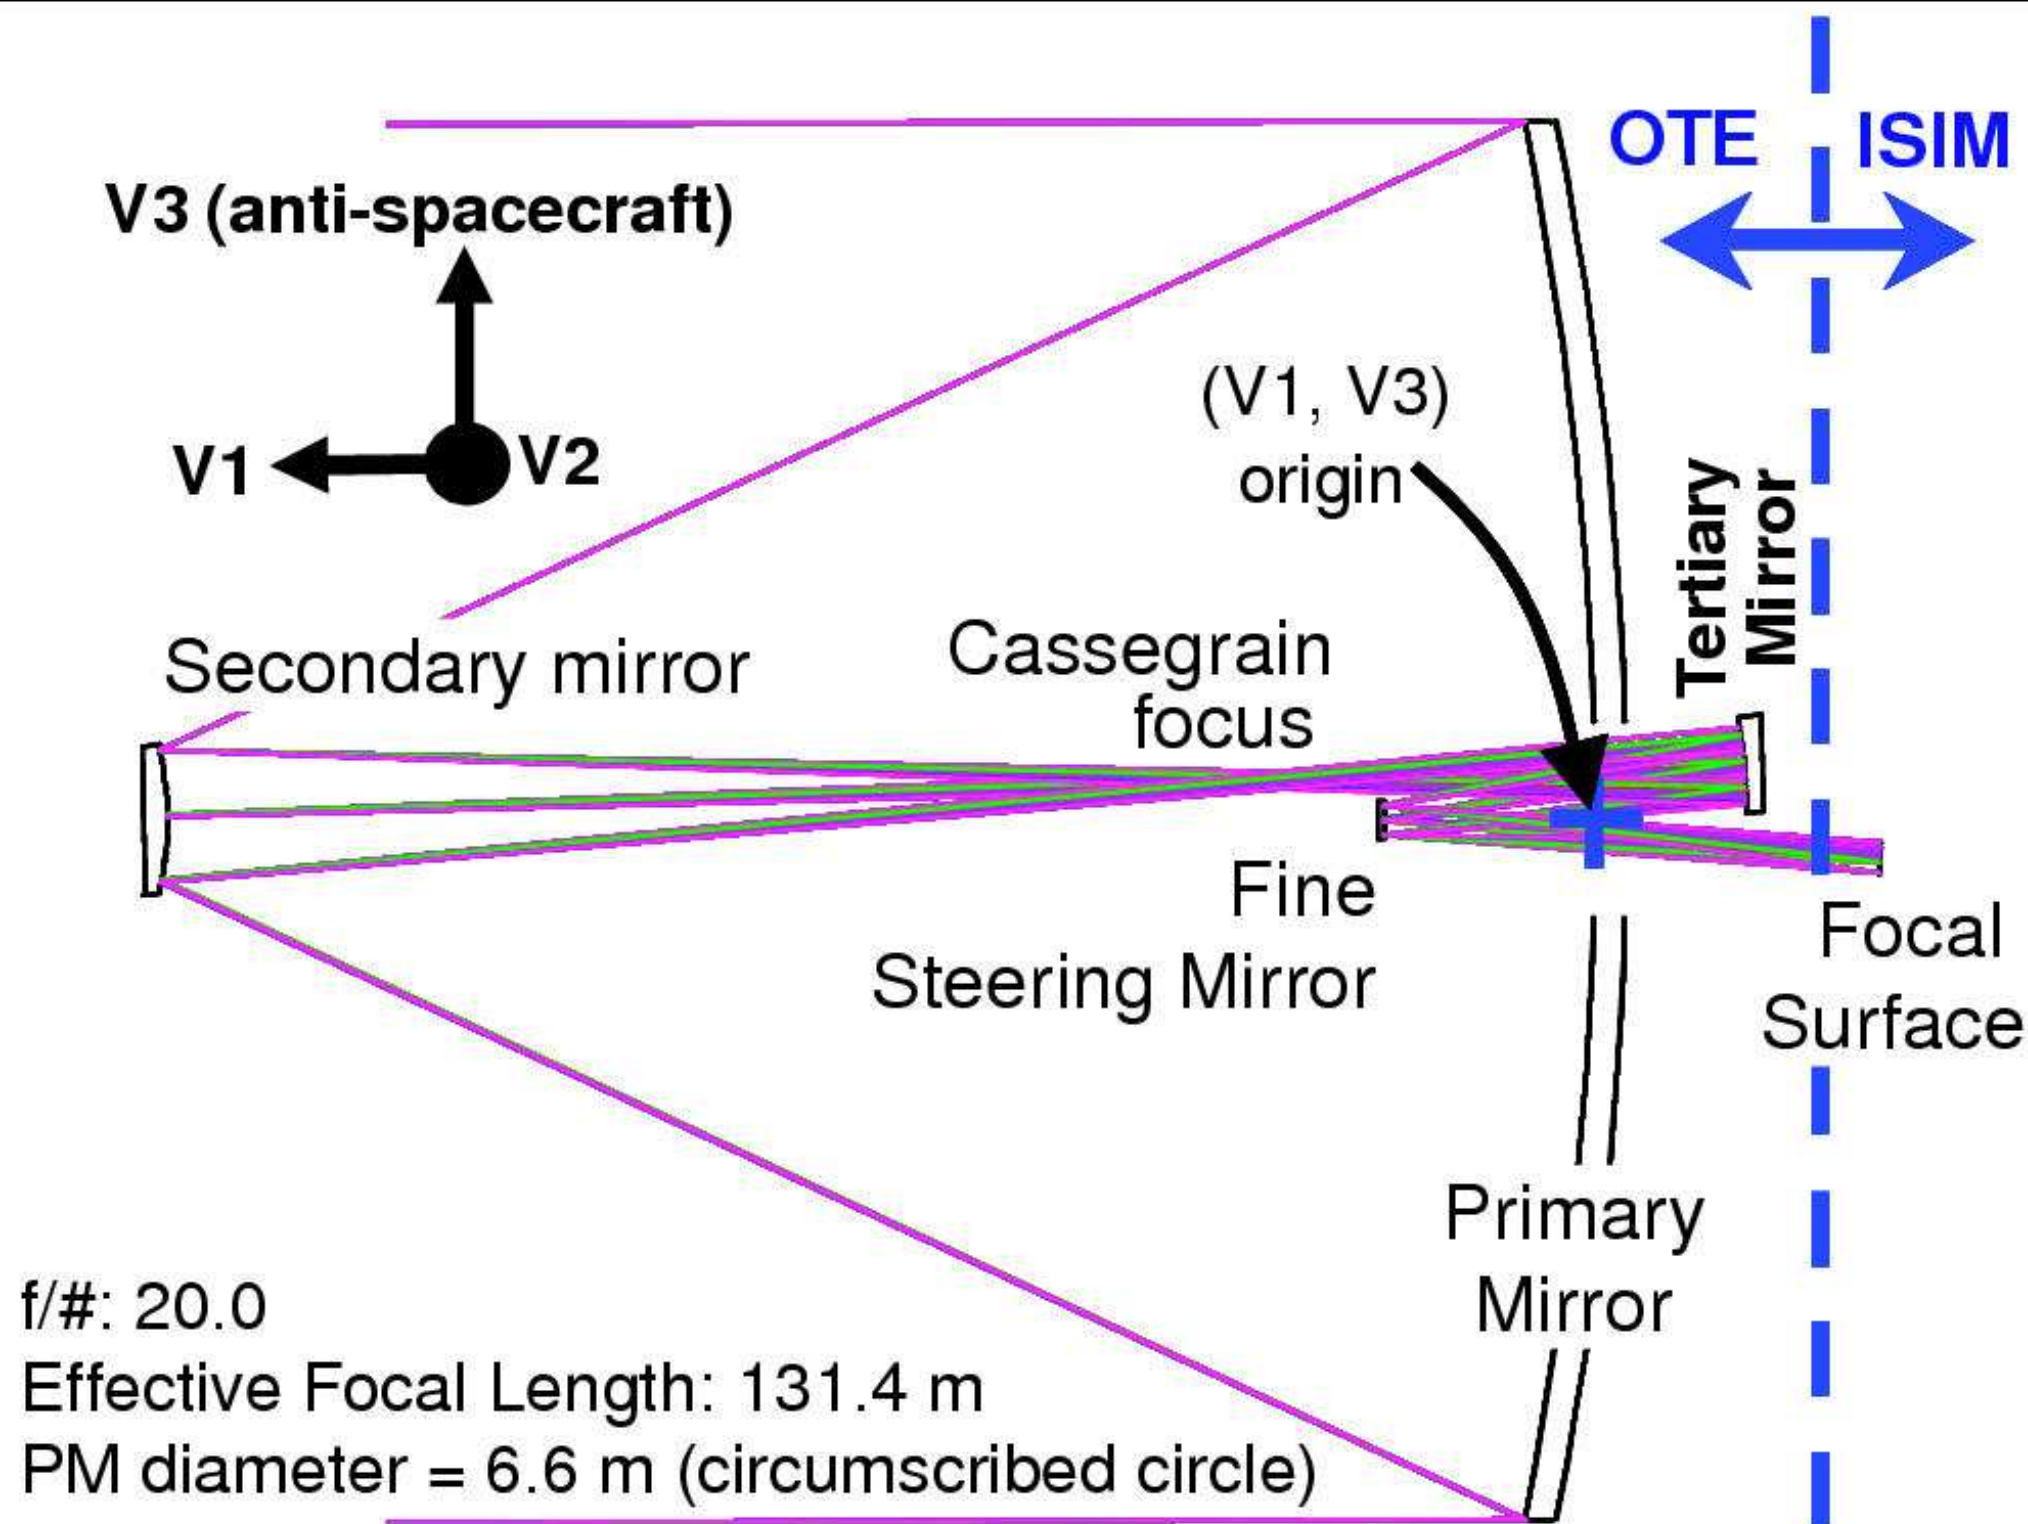

The entire JWST deployment sequence can and will be tested several times on the ground — but in 1-G.

JWST can observe segments of sky that move around as it orbits the Sun.

JWST mission reviewed in Gardner, J. P., Mather, J. C., et al. 2006, Space Science Reviews, Vol. 123, pg. 485–606 ([astro-ph/0606175](#))

Actuators for 6 degrees of freedom rigid body motion

Active mirror segment support through hexapods (7 d.o.f.), similar to Keck.

Edge-to-edge diameter is 6.60 m, but effective circular diameter is 5.85 m.
Primary mirror segments are made (AxSys). Now being polished (Tinsley).

Despite NASA's CAN-do approach: Must find all the cans-of-worms ...

WFE < 200 μm (rms)

WFE: < 250 μm rms

WFE < 1 μm (rms)

WFE: < 5 μm (rms)

WFE < 110 nm (rms)

WFE: < 150 nm (rms)

WFE < 110 nm (rms)

JWST's Wave Front Sensing and Control is similar to that at Keck and HET.

Successful 2006 demo of H/W, S/W on 6/1 scale model ($2\ \mu\text{m}$ -Strehl $\gtrsim 0.85$).

Need WFS-updates every ~ 14 days, depending on scheduling/SC-illumination.

Ball 1/6-scale model: WFS produces diffraction-limited images at $2.0\ \mu\text{m}$.

- (2) What instruments will JWST have? US (UofA, JPL), ESA, and CSA.

Instrument Overview

Fine Guidance Sensor (FGS)

- Ensures guide star availability with >95% probability at any point in the sky
- Includes Narrowband Imaging Tunable Filter
- Developed by Canadian Space Agency & COM DEV

Near Infra-Red Camera (NIRCam)

- Detects first light galaxies and observes galaxy assembly sequence
- 0.6 to 5 microns
- Supports Wavefront Sensing & Control
- Developed by Univ. of AZ & LMATC

Mid-Infra-Red Instrument (MIRI)

- Distinguishes first light objects; studies galaxy evolution; explores protostars & their environs
- Imaging and spectroscopy capability
- 5 to 27 microns
- Cooled to 7K by Cyro-cooler
- Combined European Consortium/JPL development

Near Infra-Red Spectrograph (NIRSpec)

- Measures redshift, metallicity, star formation rate in first light galaxies
- 0.6 to 5 microns
- Simultaneous spectra of >100 objects
- Developed by ESA & EADS with NASA/ GSFC Detector & Microshutter Subsystems

- (2) What instruments will JWST have?

All JWST instruments can in principle be used in parallel observing mode:

- Currently only being implemented for parallel *calibrations*.

NIRCam Dichroic Beamsplitter

NIRCam Pupil Imaging Lens Set

NIRCam Detectors

SiAs MIR Detector

NIRSpec Microshutter

NIRSpec Calibration Assembly

NIRSpec Mirror

MIRI Electronics

NIRSpec Fore Optics Mirror Assembly

FGS/TF Etalon Filter

NIRSpec Image Slicer Mirror

Some critical-path JWST flight hardware is currently being constructed.

Layout of JWST NIRCam — the UofA–Lockheed NIR-Camera

- (2) What instruments will JWST have?

MIRI Verification Model Yfirst lightZ

The Mid-Infra-Red Instrument MIRI made by an UofA + JPL + ESA consortium will do imaging and spectroscopy from 5–28 μm . MIRI is actively cooled by a cryocooler, so that its lifetime is not limited by consumables.

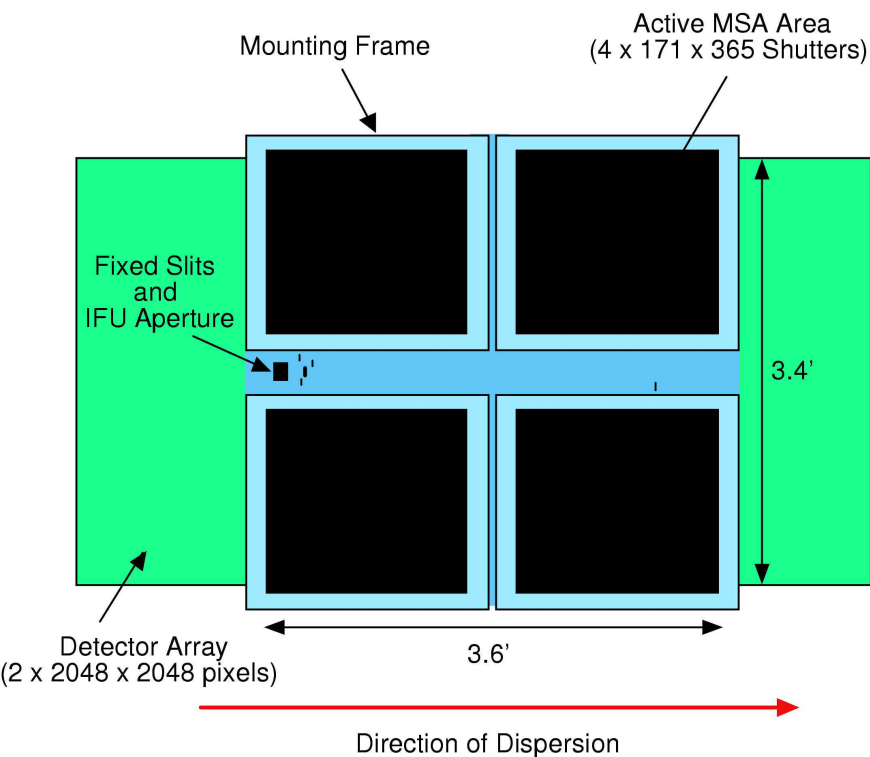

Figure 50. Schematic illustration of the MIRI IFU image slicer format (left) and dispersed spectra on detector (right)

The MIRI Integral Field Unit (IFU) has an image slicer that makes spatially resolved spectra at wavelengths $5 \mu\text{m} \lesssim \lambda \lesssim 9 \mu\text{m}$.

Layout of NIRSpec — the EU NIR-Spectrograph

JWST offers significant multiplexing for faint object spectroscopy:

- NIRSpec/MSA with $4 \times 62,415$ independently operable micro-shutters that cover $\lambda \simeq 1\text{--}5 \mu\text{m}$ at $R \simeq 100\text{--}1000$.
- MIRI/IFU with 400 spatial pixels covering $5\text{--}28.5 \mu\text{m}$ at $R \sim 2000\text{--}4000$.
- FGS/TFI that covers a $2!2 \times 2!2$ FOV at $\lambda \simeq 1.6\text{--}4.9 \mu\text{m}$ at $R \simeq 100$.

Astronomy Scene

Metal Mask/Fixed Slit

Shutter Mask

- (2) What sensitivity will JWST have?

The NIRCam and MIRI sensitivity complement each other, straddling $5 \mu\text{m}$ in wavelength, and together allow objects to be found to redshifts $z=15-20$ in $\sim 10^5$ sec (28 hrs) integration times.

LEFT: NIRCam and MIRI broadband sensitivity to a Quasar, a “First Light” galaxy dominated by massive stars, and a 50 Myr “old” galaxy at $z=20$.

RIGHT: Relative survey time vs. λ that Spitzer, a ground-based IR-optimized 8-m (Gemini) and 30-m telescope would need to match JWST.

240 hrs HST/ACS in $Vi'z'$ in the Hubble UltraDeep Field (HUDF)

6.5m JWST Point-Spread-Function (PSF) models (Ball Aerospace & GSFC):

NIRCam 0.7 μm 1.0 μm (<150 nm WFE) 2.0 μm (diffr. limit)

Design PSF's are shown at logarithmic stretch: they have $\gtrsim 74\%$ EE at $r \lesssim 0.15$ at $1.0\mu\text{m}$, and are diffraction limited at $2.0\mu\text{m}$ (Strehl $\gtrsim 0.80$).

~18 hrs JWST NIRCams at 0.7, 0.9, 2.0 μm in the HUDF

Truth \equiv 240 hrs HUDF $V i' z'$ 18 hrs JWST 0.7, 0.9, 2.0 μm

- Can't beat redshift: to see First Light, must observe near-mid IR.
- ⇒ This is why JWST needs NIRCам at 0.8–5 μm and MIRI at 5–28 μm .

(3a) What is First Light, Reionization, and Galaxy Assembly?

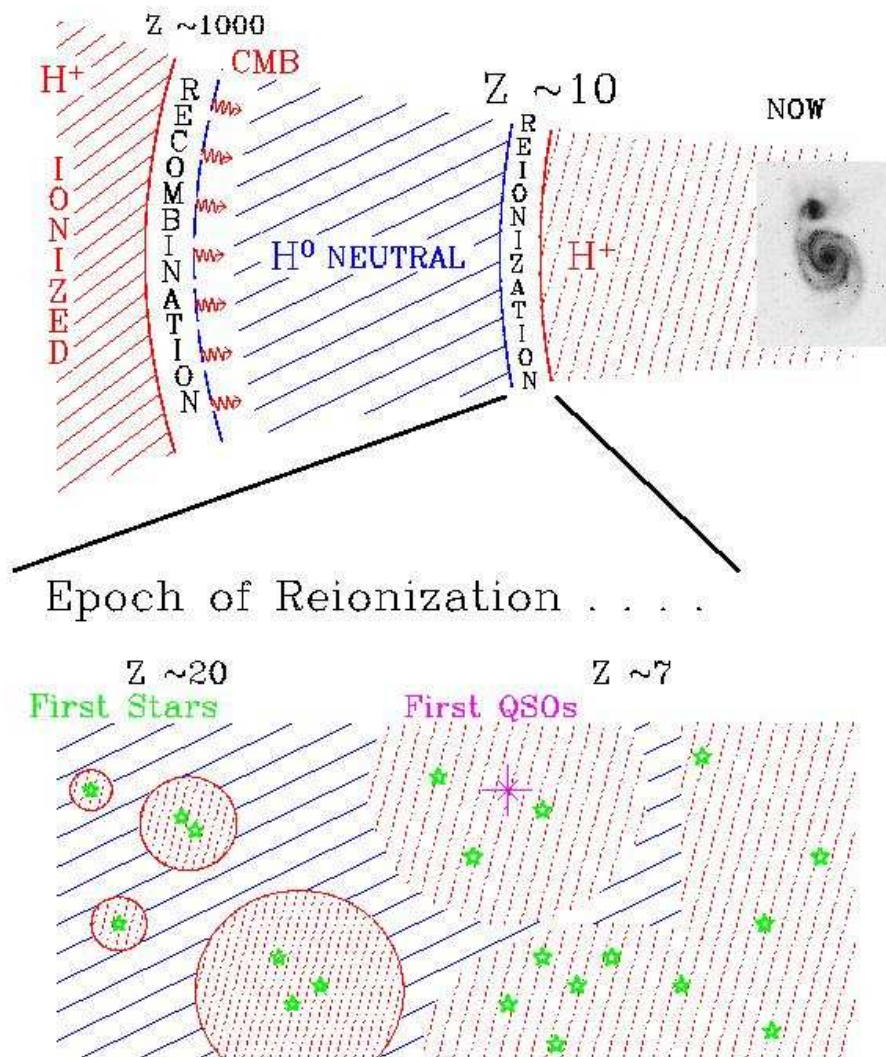

NASA telescopes penetrating Cosmic Dawn, First Light, & Recombination

- (3a) What is First Light and Reionization?

- Detailed Hydrodynamical models (V. Bromm) show that formation of Pop III stars reionized universe for the first time at $z \lesssim 10-30$ (First Light).
- A this should be visible to JWST as the first Pop III stars and surrounding star clusters, and perhaps their extremely luminous supernovae at $z \simeq 10 \rightarrow 30$.

End of 'The Dark Age'

WMAP: First Light may have happened as following:

- (0) Dark Ages since recombination ($z=1089$) until First Light objects started shining ($z \gtrsim 11-20$).
- (1) First Light when Population III stars start shining with mass $\gtrsim 100-200 M_{\odot}$ at $z \gtrsim 11-20$.
- (2) Pop III supernovae heated IGM, which perhaps could not cool and form normal Pop II halo stars in bulk until $z \simeq 9-10$.
- (3) This is followed by Pop II stars forming in dwarf galaxies (mass $\simeq 10^7-10^9 M_{\odot}$) at $z \simeq 6-9$, ending the epoch of reionization.

(Fig. courtesy of Dr. F. Briggs)

Distant Galaxies in the Hubble Ultra Deep Field
Hubble Space Telescope • Advanced Camera for Surveys

NASA, ESA, R. Windhorst (Arizona State University) and H. Yan (Spitzer Science Center, Caltech)

STScI-PRC04-28

HUDF i-drops: faint galaxies at $z \simeq 6$ (Yan & Windhorst 2004), most spectroscopically confirmed at $z \simeq 6$ to $AB \lesssim 27.0$ mag (Malhotra et al. 2005).

- (3b) How JWST can measure First Light and Reionization

HUDF shows that luminosity function of $z \simeq 6$ objects (Yan & Windhorst 2004a, b) may be very steep: faint-end Schechter slope $|\alpha| \simeq 1.6-2.0$.

\Rightarrow Dwarf galaxies and not quasars likely completed the reionization epoch at $z \simeq 6$. This is what JWST will observe in detail for $z \gtrsim 7-20$.

- With proper survey strategy (area AND depth), JWST can trace the entire reionization epoch and detect the first star-forming objects.
- Objects at $z \gtrsim 9$ are rare, since volume element is small and JWST samples brighter part of LF. JWST needs the quoted sensitivity/aperture (A), field-of-view ($\text{FOV}=\Omega$), and wavelength range ($0.7-28 \mu\text{m}$).

- (4) What is, & how can JWST measure Galaxy Assembly?

One of the remarkable discoveries of HST was how numerous and small faint galaxies are — the building blocks of the giant galaxies seen today.

- (4a) What is Galaxy Assembly?

- Galaxies of all Hubble types formed over a wide range of cosmic time, but with a notable phase transition around $z \simeq 0.5\text{--}1.0$:

(1) Subgalactic units rapidly merge from $z \simeq 7 \rightarrow 1$ to grow bigger units.

(2) Merger products start to settle as galaxies with giant bulges or large disks around $z \simeq 1$. These evolved mostly passively since then, resulting in the giant galaxies that we see today.

- JWST can measure how galaxies of all types formed over a wide range of cosmic time, by accurately measuring their distribution over rest-frame structure and type as a function of redshift or cosmic epoch.

THE HUBBLE DEEP FIELD CORE SAMPLE ($I < 26.0$)

Fourier Decomposition is a robust way to measure galaxy morphology and structure in a quantitative way (Odewahn et al. 2002):

- (1) Fourier series are made in successive concentric annuli.
- (2) Even Fourier components indicate symmetric parts (arms, rings, bars).
- (3) Odd Fourier components indicate asymmetric parts (lopsidedness).
- (4) JWST can measure the evolution of each feature/class directly.

Total EII/S0 Sabc Irr/Mergers

- JWST can measure how galaxies of all Hubble types formed over a wide range of cosmic time, by measuring their redshift distribution as a function of rest-frame type.
- For this, the types must be well imaged for large samples from deep, uniform and high quality multi-wavelength images, which JWST can do.

Driver et al. 1998, Astrophys. J. Letters, 496, L93

Faint-end LF-Slope Evolution (fundamental, like local IMF)

Faint-end LF-slope at $z \gtrsim 1$ with accurate ACS grism z 's to $AB \lesssim 27$ (Cohen et al.; Ryan et al. 2007, ApJ, 668, 839) constrains hierarchical formation:

- Star-formation and SN feedback produce different faint-end slope-evolution: new physical constraints (Khochfar et al. 2007, ApJL, 668, L115).
- JWST will provide fainter spectra ($AB \lesssim 29$) and spectro-photometric redshifts to much higher z ($\lesssim 20$). JWST will trace α -evolution for $z \lesssim 12$.
- Can measure environmental impact on faint-end LF-slope α directly.
- Expect convergence to slope $|\alpha| \equiv 2$ at $z > 6$ before feedback starts.
- Constrain onset of Pop III SNe epoch, Type II & Type Ia SN-epochs.

(5) Predicted Galaxy Appearance for JWST at $z \simeq 1-15$

- The uncertain rest-frame UV-morphology of galaxies is dominated by young and hot stars, with often copious amounts of dust superimposed.
- This makes comparison with very high redshift galaxies seen by JWST complicated, although with good images a quantitative analysis of the restframe-wavelength dependent morphology and structure can be made.

(5) Predicted Galaxy Appearance for JWST at $z \simeq 1-15$

HST $z=0$ JWST $z=2$ $z=5$ $z=9$ $z=15$

With proper restframe-UV training, JWST can quantitatively measure the evolution of galaxy morphology and structure over a wide range of cosmic time:

- (1) Most disks will SB-dim away at high z , but most formed at $z \lesssim 1-2$.
- (2) High SB structures are visible to very high z .
- (3) Point sources (AGN) are visible to very high z .
- (4) High SB-parts of mergers/train-wrecks, etc., are visible to very high z .

(6) Conclusions

(1) JWST Project is technologically front-loaded and well on track:

- All critical items at Technical Readiness Level 6 (TRL-6) by Jan. 2007 (*i.e.*, demonstration in a relevant environment — ground or space).
- Passed Technical Non-Advocate Review (T-NAR) in 2007, and will undergo Mission Preliminary Design Review (PDR) in March 2008.

(2) JWST will map the epochs of First Light, Reionization, and Galaxy Assembly in detail. It will determine:

- The formation and evolution of the first (reionizing) Pop III star-clusters.
- Faint-end LF-slope evolution: how dwarf galaxies finished reionization.
- The origin of the Hubble sequence in hierarchical formation scenarios.

(3) JWST will have a major impact on astrophysics after 2013:

- Current generation of graduate students and postdocs will be using JWST during their professional career.
- JWST will define the next frontier to explore: the Dark Ages at $z \gtrsim 20$.

What can JWST do Star- and Planet Formation?

JWST will trace various stages of star-formation, YSO's, debris-disk formation and planet formation through very high-resolution imaging, coronagraphy, & high-resolution optical-IR spectra.

JWST provides high time-resolution photometry & coronagraphy for planet detection, and *panchromatic* low-resolution near-mid-IR spectra.

JWST: Very high-res imaging, coronagraphy, & high-res optical-IR spectra.

JWST: High time-res photometry, coronagraphy, & low-res mid-IR spectra.

Northrop Grumman Expertise in Space Deployable Systems

- Over 45 years experience in the design, manufacture, integration, verification and flight operation of spacecraft deployables
- 100% mission success rate, comprising over 640 deployable systems with over 2000 elements

Baseline “Cup Down” Tower Configuration at JSC (Before)

Most recent Tower Design shows an Inner Optical Tower supported by a Outer structure with Vibration Isolation at the midplane. Everything shown is in the 20K region (helium connections, etc. not shown) except clean room and lift fixture.

Current plan calls for 33KW cooldown capability, 12 KW steady state, 300-500mW N₂ cooling

JSC currently has 7 KW He capability

Current plan includes 10 trucks of LN₂/day during cooldown

Interferometers, Sources, Null Lens and Alignment Equipment Are in Upper and Lower Pressure Tight Enclosure Inside of Shroud

JSC “Cup Up” Test Configuration (New Proposal)

No Metrology Tower and Associated Cooling H/W.

External Metrology

Two basic test options:

1. Use isolators, remove drift through fast active control + freeze test equipment jitter
 2. Eliminate vibration isolators (but use soft dampeners) to avoid drift, freeze out jitter
- Builds on successful AMSD heritage of freezing and averaging jitter, testing through windows.

Possible payload “floor” to separate ambient pressure and temperature.

Drawing care of ITT

Page 6

JWST underwent several significant replans and risk-reduction schemes:

- $\lesssim 2003$: Reduction from 8.0 to 7.0 to 6.5 meter. Ariane-V launch vehicle.
- 2005: Eliminate costly 0.7-1.0 μm performance specs (kept 2.0 μm).
- 2005: Simplification of thermal vacuum tests: cup-up, not cup-down.
- 2006: All critical technology at Technical Readiness Level 6 (TRL-6), *i.e.*, demonstration in a relevant environment — ground or space.
- 2007: Further simplification of sun-shield and end-to-end testing.

Hubble Space Telescope Program

FPA 160 QE

May 2, 2007

Wide Field Camera 3 Monthly Status Review

06/10/07_PMB_STEC.ppt

11

WFC3/UVIS channel has unprecedented UV–blue throughput & areal coverage:

- $QE \gtrsim 70\%$, $4k \times 4k$ array of $0''.04$ pixel, $FOV \simeq 2'.67 \times 2'.67$

WFC3/IR channel has unprecedented near-IR throughput & areal coverage:

- $QE \gtrsim 70\%$, $1k \times 1k$ array of $0''.13$ pixel, $FOV \simeq 2'.25 \times 2'.25$

\Rightarrow WFC3 will offer major new parameter space for astrophysics in $\gtrsim 2008$

Power of combination of Grism and Broadband for WFC3

Lessons from the Hubble ACS grism surveys “GRAPES” and “PEARS” (Malhotra et al. 2005; Cohen et al. 2007; Ryan et al. 2007, ApJ, 668, 839):

- (a) Spectro-photo-z’s from HST grism + BViz(JH) considerably more accurate than photo-z’s alone, with much smaller catastrophic failure %.
- (b) Redshifts for $\gtrsim 13,000$ objects to $AB \gtrsim 27.0-27.5$ mag; $\sigma_z / (1+z) \lesssim 0.04$.
- (c) Expect $\lesssim 0.02-0.03$ accuracy when including new capabilities of WFC3: **UV** and **near-IR** broad-band imaging and low-res grism spectroscopy.
- WFC3 will provide full panchromatic sampling of faint galaxy spectra from $0.2-1.7 \mu\text{m}$, permitting high accuracy photo-z’s for faint galaxies of all types to $AB \simeq 27.0-29.0$ mag (for $\sim 2-80$ orbits/filter).

MORE SPARE CHARTS

App. 2: What is the Lyman continuum escape fraction of Dwarf Galaxies?

- GALEX, HST/UV and Spitzer IRAC images of nearby late-type dwarf galaxies suggests enough (SN-driven?) holes between their dust that UV-photons can escape: covering factors $\gtrsim 20\%$ ($\propto f_{esc}$? \leftrightarrow HI).
- Steidel et al. (2001): $z \simeq 3$ LBG's have UV-escape fraction $f_{esc} \simeq 10\%$.
- Yan & Windhorst (2004) assume that f_{esc} at $z \simeq 6$ is at least as high.

- A steep LF of $z \simeq 6$ objects (Yan & Windhorst 2004a, ApJL, 600, L1) could provide enough UV-photons to complete the reionization epoch at $z \simeq 6$ (if $f_{esc} \gtrsim 10\%$).
- Pop II dwarf galaxies may not have started shining *per-vasively* much before $z \simeq 7-8$, or no H-I would be seen in the foreground of $z \gtrsim 6$ quasars.
- JWST will measure this numerous population of dwarf galaxies from the end of the reionization epoch at $z \simeq 6$ into the epoch of First Light (Pop III stars) at $z \gtrsim 10$.

Caveat: Can the Hard-UV of weak AGN outshine Dwarf Galaxies?

- In principle, the hard-UV of QSO's and weak AGN can outdo the young SED's of LBG's or dwarf galaxies, but likely by no more than $\gtrsim 1$ dex.

Possible local analogs for dwarf galaxies that finished reionization at $z \gtrsim 6$?

- Low metallicity Ultra-Blue Compact Dwarf galaxies in voids (Corbin et al. 2006, 2007).

ACS/HRC (Corbin et al. 2006) shows that:

- All have an old ($\gtrsim 10$ Gyr) stellar pop.
- All have young 1-100 Myr star-clusters.

Their low metallicities are more likely SN-driven, rather than due to purely young stellar populations \Rightarrow must measure Lyman continuum f_{esc} .

Possible local analogs for dwarf galaxies that finished reionization at $z \gtrsim 6$:

- Low metallicity Ultra-Blue Compact Dwarf galaxies in voids (Corbin et al. 2006, 2007).

High-res ACS/HRC (H. Kim et al. 2008) resolves individual (super) giants.

Color-magnitude and color-color diagrams imply very little dust extinction
 \Rightarrow must measure f_{esc} .

Possible local analogs for dwarf galaxies that finished reionization $z \gtrsim 6$?:

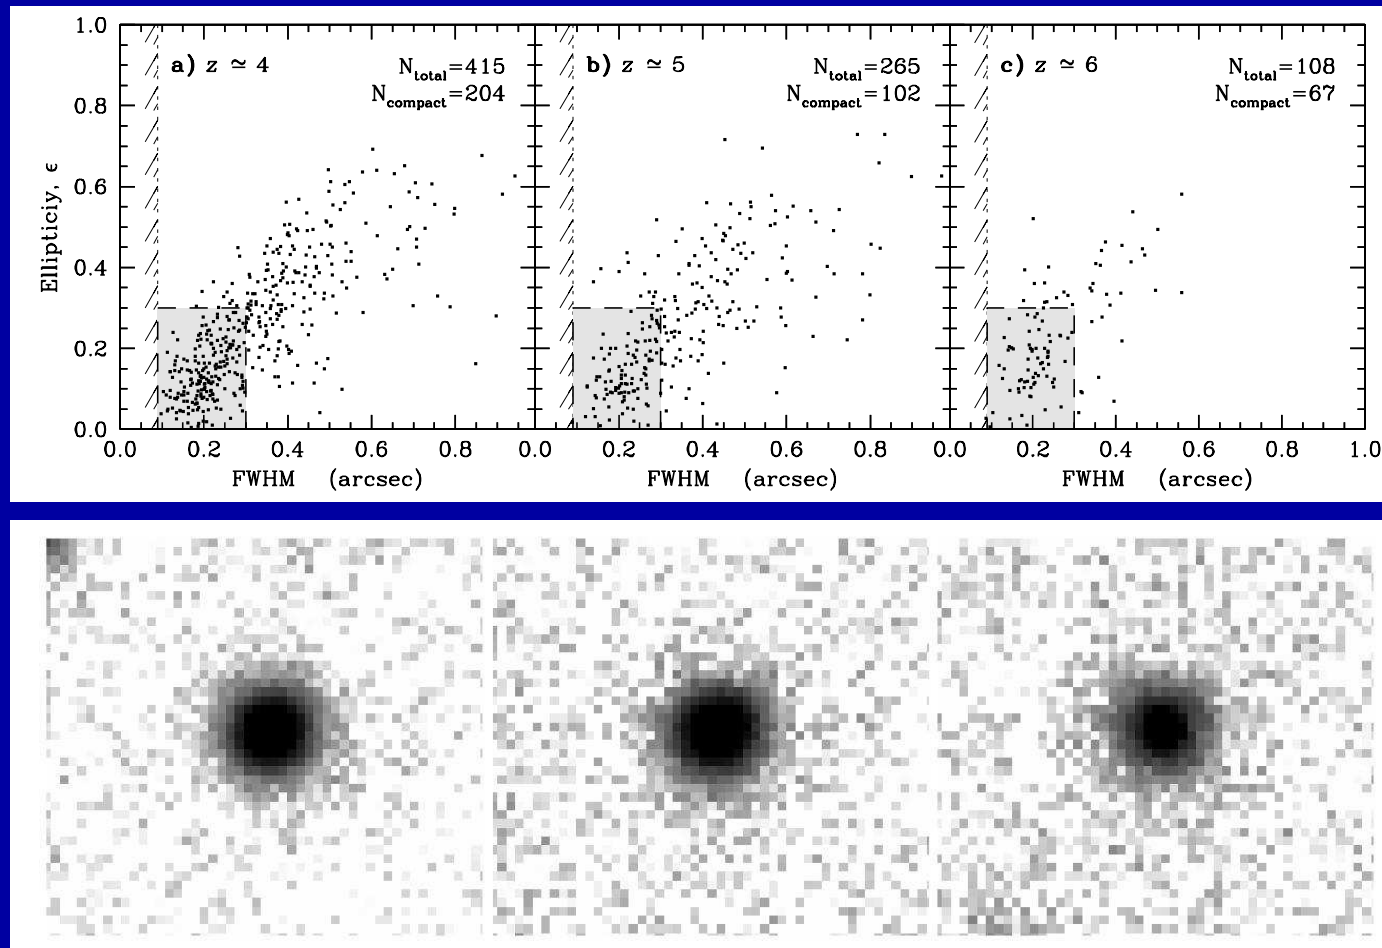

- Small late-type/Irregular galaxies that dominate the FBG population and its $N(z)$ at $z \gtrsim 1.5$ (Driver et al. 1998). Also, UVLG's (Overzier et al. 2007).

- Combination of GALEX FUV+NUV, HST-mid-UV, ground-based UB-VRI, & Spitzer IRAC on local late-types/Irr's shows:

Hot stars and $8 \mu\text{m}$ dust more spatially anti-correlated than correlated (Tamura et al. 2007): SN-driven? Localized, large f_{esc} from SN-bubbles?

- Measure Lyman continuum escape fraction and its geometry with a dedicated FUV space mission (Lyman).

Dynamical ages of Dwarf Galaxies at $z \simeq 4-6$?

- Select all isolated, nearly unresolved ($2r_e \lesssim 0''.3$), round ($1-b/a \lesssim 0.3$) HUDF B-drops, V-drops, and i-drops. to AB=29.0 mag
- Construct average image stack and light-profiles of these dwarf galaxies at $z \simeq 4$, $z \simeq 5$, and $z \simeq 6$.
- If these compact, round objects are intrinsically comparable, each stack has the S/N of ~ 5000 HST orbits ($\simeq 300$ JWST hrs; Hathi et al. 2007).

Dynamical ages of Dwarf Galaxies at $z \simeq 4-6$?

- HUDF sky-subtraction error is $2-3 \cdot 10^{-3}$ or $AB \simeq 29.0-30.0$ mag/arcsec²
- Average 5000-orbit compact, round dwarf galaxy light-profile at $z \simeq 6-4$ deviates from best fit Sersic $n \simeq 1.0$ law (incl. PSF) at $r \gtrsim 0''.27-0''.35$.
- If interpreted as virial radii in hierarchical growth, these imply dynamical ages of $\tau_{dyn} \simeq 0.1-0.2$ Gyr at $z \simeq 6-4$ for the enclosed masses.
- ⇔ Comparable to their SED ages (Hathi et al. 2007, AJ; astro-ph/0710.0007).
- ⇒ Global starburst that finished reionization at $z \simeq 6$ started at $z \simeq 6.6$?
