The Universe Beyond Hubble: The James Webb Space Telescope

Rogier Windhorst (ASU) — JWST Interdisciplinary Scientist

S. Cohen, R. Jansen, L. Nolan, & R. O'Brien (ASU), C. Conselice (UK), S. Driver (OZ), & H. Yan (U-MO)

(Ex) ASU Grads: N. Hathi, H. Kim, M. Mechtley, R. Ryan, Rutkowski, B. Smith, & A. Straughn

 $1973 \sim 2020^+; \qquad 1996 \sim 2031; \qquad 2000 \sim 2050^+ \qquad 2020 \sim 2050^+?$

Talk at Prescott Astronomy Club, Wednesday Mar. 2, 2022 (Prescott, AZ; via Zoom) All presented materials are ITAR-cleared.

Outline

- (1) Update on the James Webb Space Telescope (JWST), 2022.
- (2) What Hubble has done: Galaxy Assembly & SMBH Growth
- (3) How can JWST measure the Epochs of First Light & Galaxy Assembly, and Supermassive Black-Hole Growth?
- (4) The Future: Next generation 20–40 m telescopes & ATLAST
 - (5) How can JWST measure Star-formation & Earth-like exoplanets?
- (6) Summary and Conclusions
 - (7) Update of JWST programmatics as of 2022.
 - (8) Where do our students end-up? Possible NASA Careers

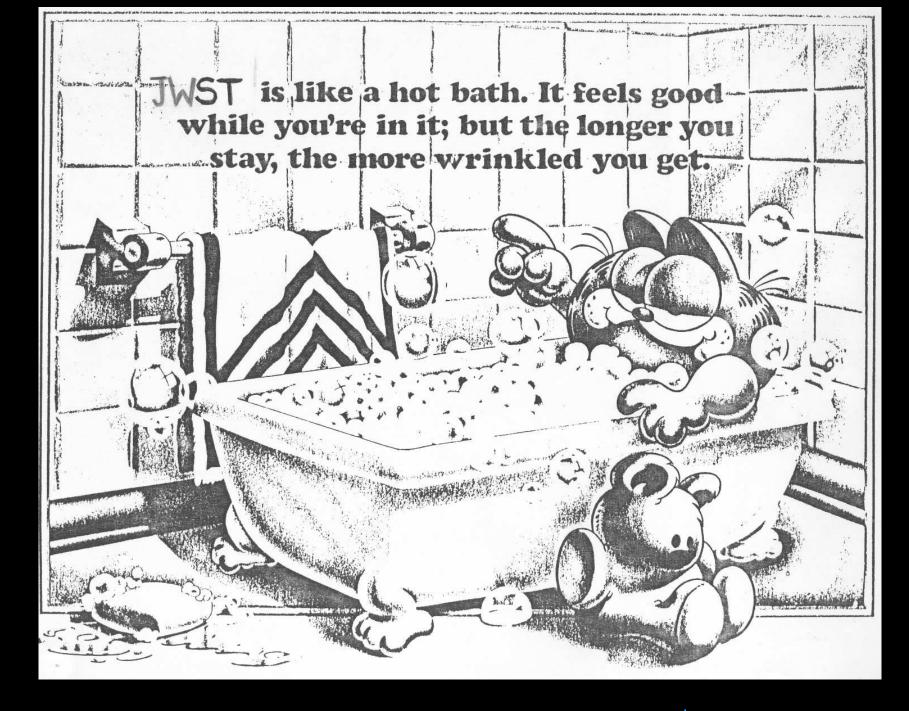

Sponsored by NASA/HST & JWST

Talk is on: http://www.asu.edu/clas/hst/www/jwst/jwsttalks/prescottAC_jwst22.pdf

I dedicate this talk to the memory of Mrs. Barbara Franklin (1950–2021; Prescott resident), who was my first Hubble student at ASU. She had a remarkable career as mother, astronomer, and teacher.

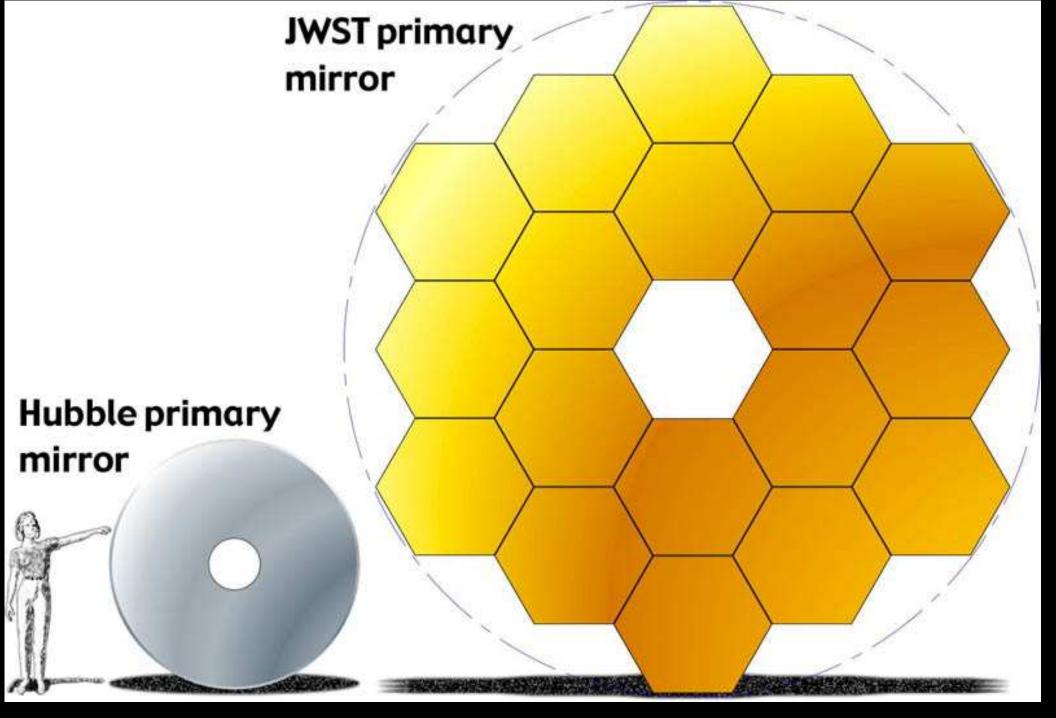

WARNING: Both Hubble and James Webb are 30–40⁺ year projects: You will feel wrinkled before you know it ... :)

Edwin P. Hubble (1889–1953) — Carnegie astronomer

James E. Webb (1906–1992) — Second NASA Administrator

Hubble: Concept in 1970's; Made in 1980's; Operational 1990– \gtrsim 2022?. JWST: The infrared sequel to Hubble from 2021–2026 (–2031?).

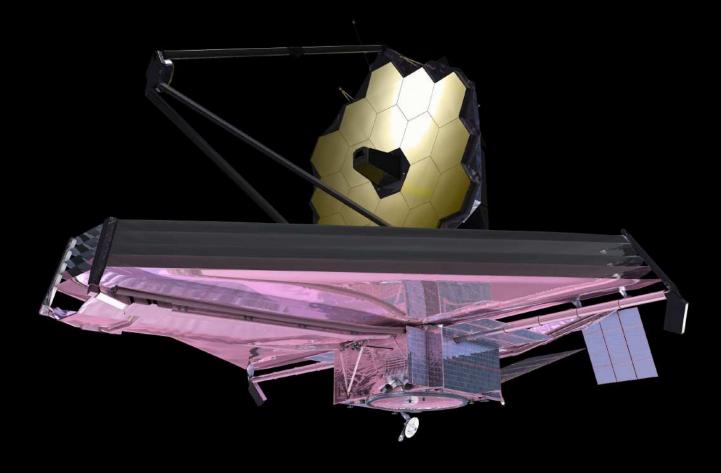

JWST $\simeq 2.5 \times$ larger than Hubble, so at $\sim 2.5 \times$ larger wavelengths: JWST has the same resolution in the near-IR as Hubble in the optical.

(1) Update of the James Webb Space Telescope (JWST), 2022

To be used by students & scientists starting 2022 ... It'll be worth it. (RIGHT) Life-size JWST prototype on the Capitol Mall, May 2007.

(1) Update of the James Webb Space Telescope as of 2022

- A fully deployable 6.5 meter (25 m²) segmented IR telescope for imaging and spectroscopy at 0.6–28 μ m wavelength, launched Dec. 25, 2021.
- Nested array of sun-shields to keep its ambient temperature at 40 K, allowing faint imaging (31.5 mag \sim 1 FF from Moon), and spectroscopy.

THE JAMES WEBB SPACE TELESCOPE

JWST LAUNCH

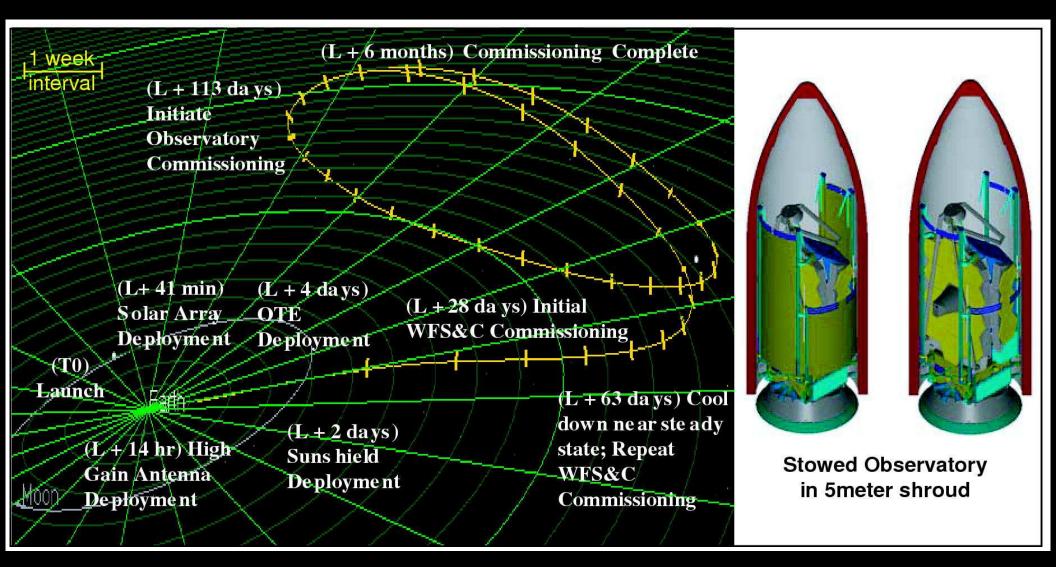

- LAUNCH VEHICLE IS AN ARIANE 5 ROCKET, SUPPLIED BY ESA
- SITE WILL BE THE ARIANESPACE'S ELA-3 LAUNCH COMPLEX NEAR
- KOUROU, FRENCH GUIANA

ARIANESPACE - ESA - NASA

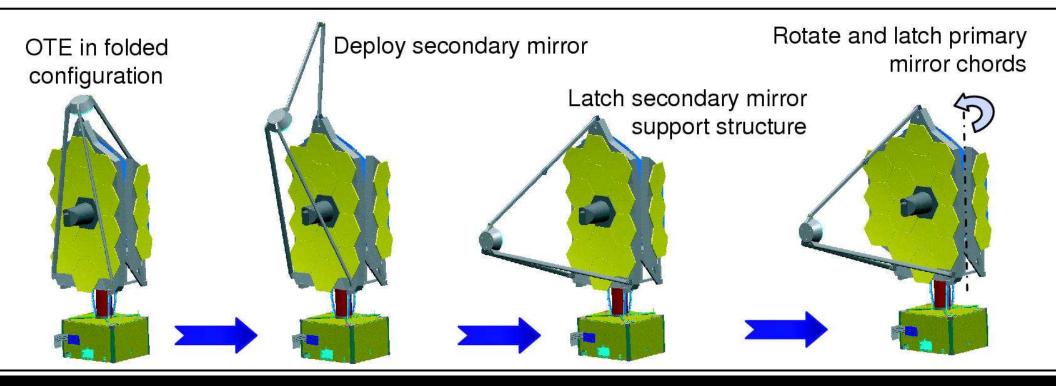

• The JWST launch weight is \lesssim 6500 kg, and it was launched to L2 with an ESA Ariane-V launch vehicle from Kourou in French Guiana.

(1a) How will JWST travel to its L2 orbit?

After launch on Dec. 25, 2022 with an ESA Ariane-V, JWST will orbit around the Earth–Sun Lagrange point L2, 1.5 million km from Earth.
JWST can cover the whole sky in segments that move along with the Earth, observe ≳70% of the time, and send data back to Earth every day.

• (1b) How will JWST be automatically deployed?

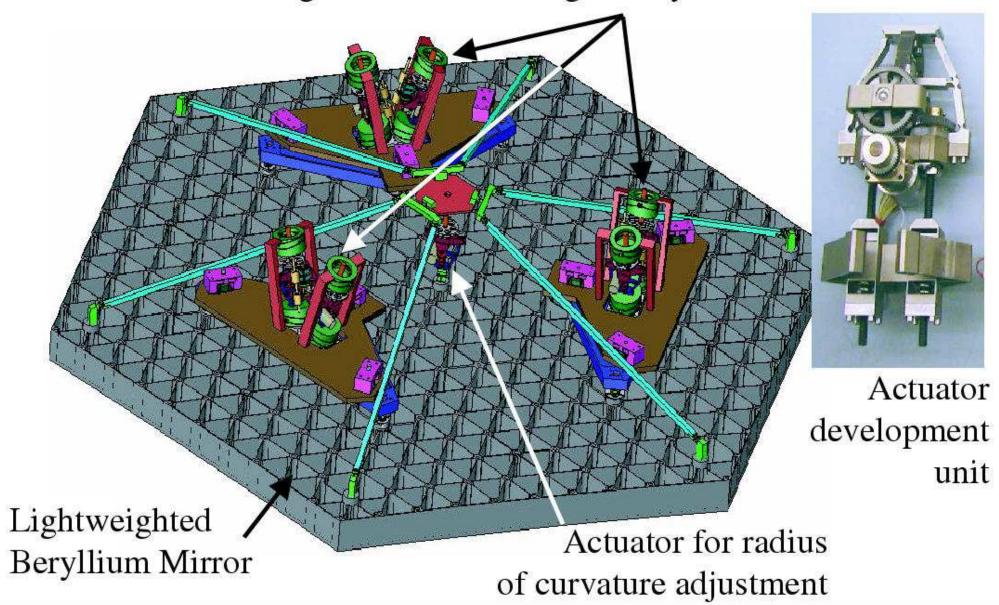

• During its two month journey to L2, JWST will be automatically deployed, its instruments will be cooled, and be inserted into an L2 orbit.

• The entire JWST deployment sequence is being tested several times on the ground — but only in 1-G: component and system tests in 2014–2019 at GSFC (MD), Northrop (CA), and JSC (Houston).

• Component fabrication, testing, & system integration: 18 out of 18 flight mirrors completely done, and meet the 40K specifications.

Actuators for 6 degrees of freedom rigid body motion

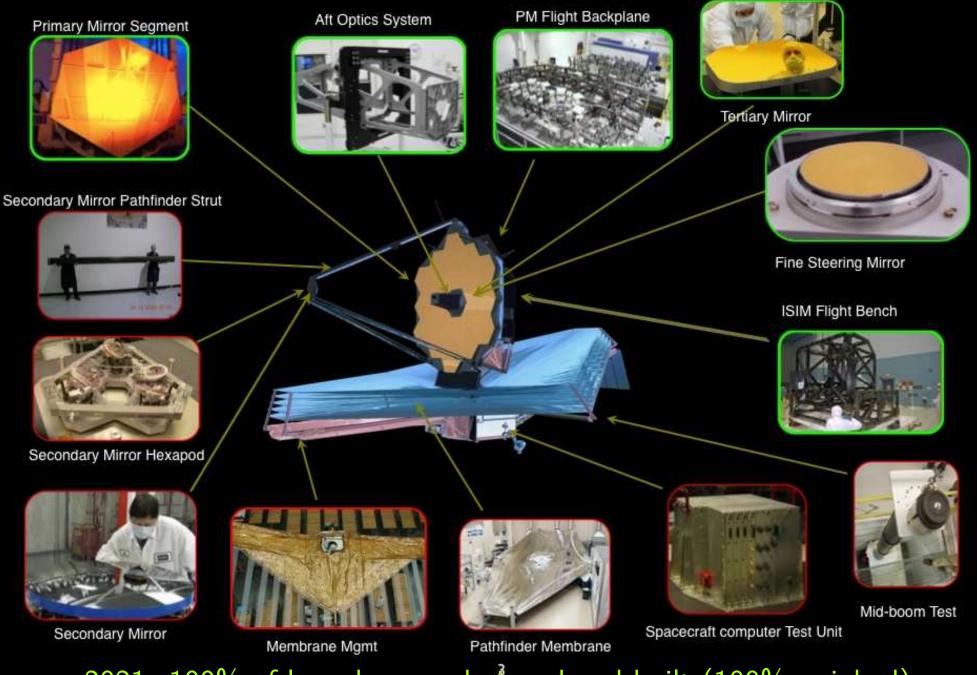

Active mirror segment support through "hexapods", similar to Keck. Redundant & doubly-redundant mechanisms, quite forgiving against failures.

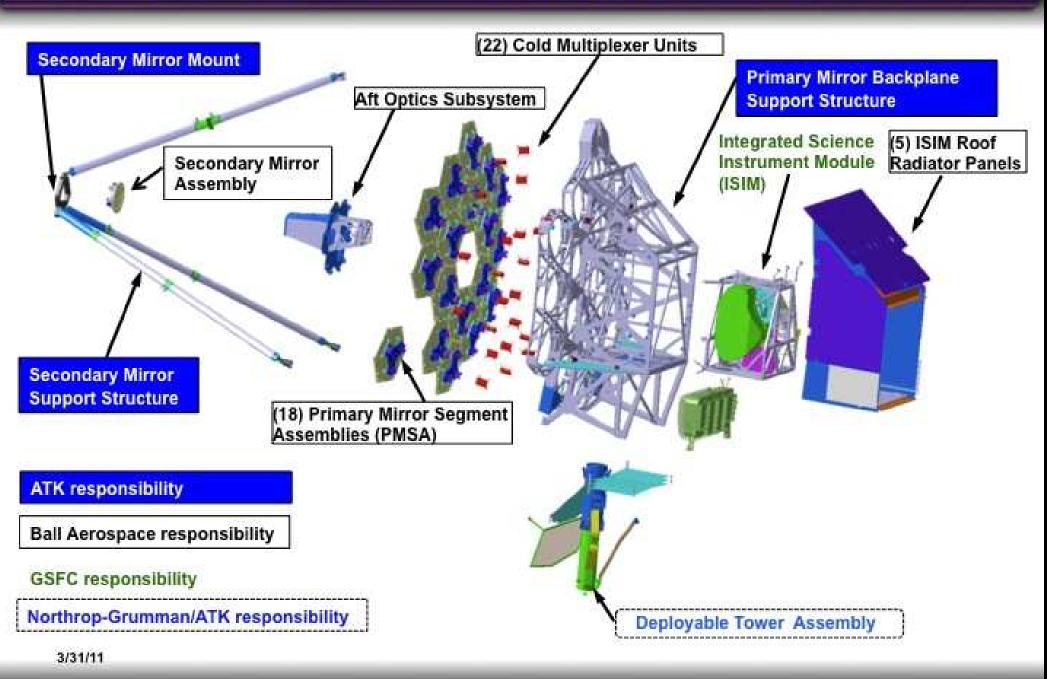

JWST Hardware Status

2021: 100% of launch mass designed and built (100% weighed).

TELESCOPE ARCHITECTURE

2014–2021: Complete system integration at GSFC and Northrop.

JWST Hardware Progress

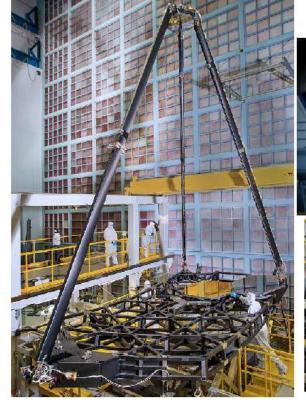

JWST remains on track for an October 2018 launch within its replan budget guidelines

July 2014: • Secondary Mirror Support deployment successfully tested. 2015: • Engineering sunshield successfully deployed at Northrop (CA).

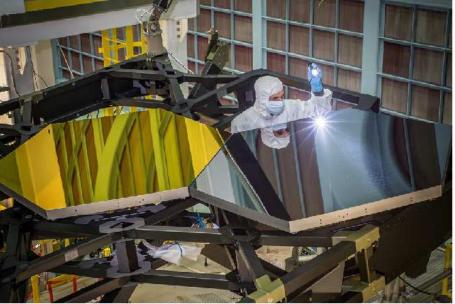

Telescope Pathfinder – Risk Reduction

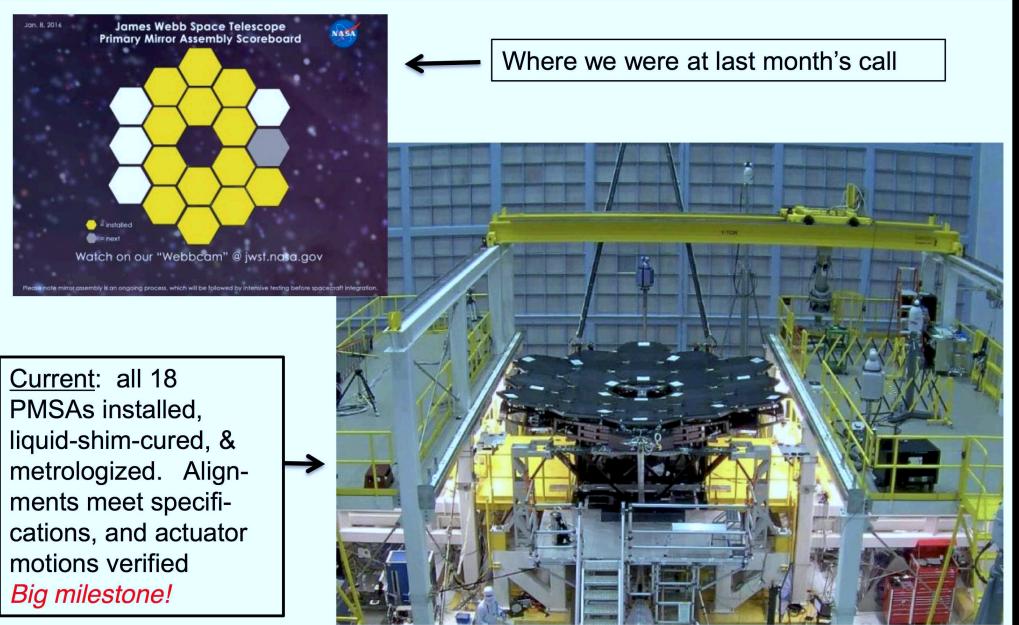

JWST Pathfinder is a partial telescope that is intended to reduce the implementation risk of the assembly, integration, and cryogenic optical test of the JWST optical assembly

Much progress has been made in OTE integration

8 February 2016 JWST Monthly Telecon 8

JWST lifetime: Requirement: 5 yrs; Goal: 10 yrs; Propellant: 14 yrs.

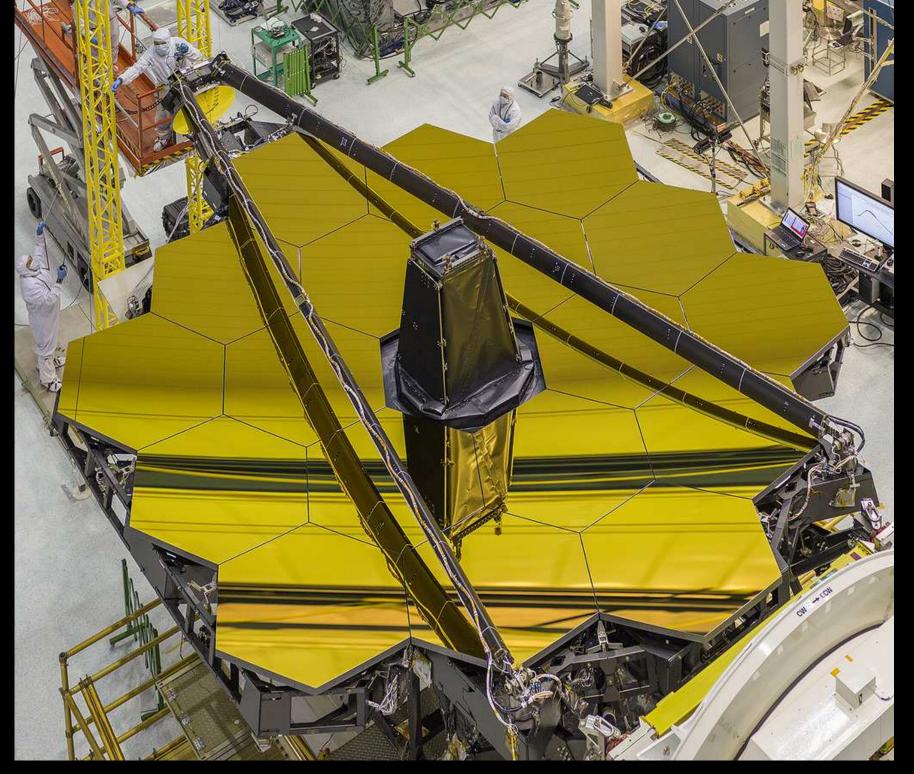

NASA team-work to take JWST mirror covers off!

JWST being tilted into the right position

Webb mirrors finally mounted and ready!

JWST stowed for further instrument mounting

All Instruments Integrated

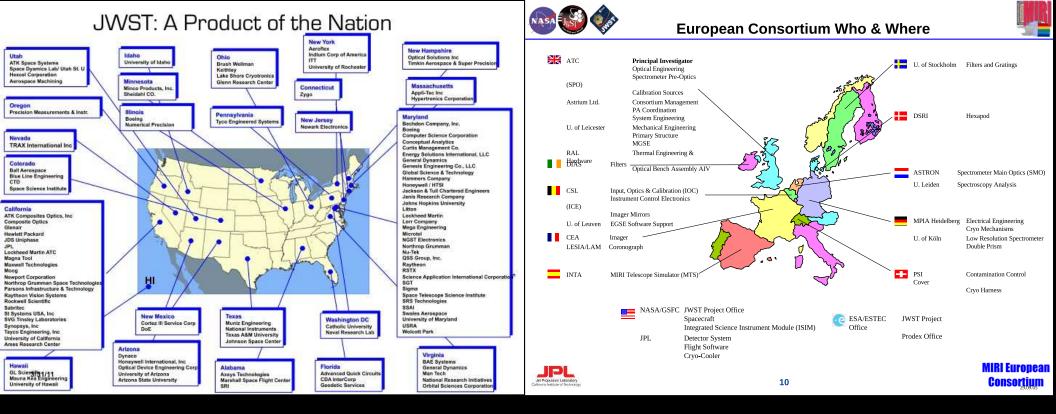

• JWST hardware made in 27 US States: 100% of launch-mass finished.

- Ariane V Launch & NIRSpec provided by ESA; & MIRI by ESA & JPL.
- JWST Fine Guider Sensor + NIRISS provided by Canadian Space Agency.
- JWST NIRCam made by UofA and Lockheed.

Stowed for Launch

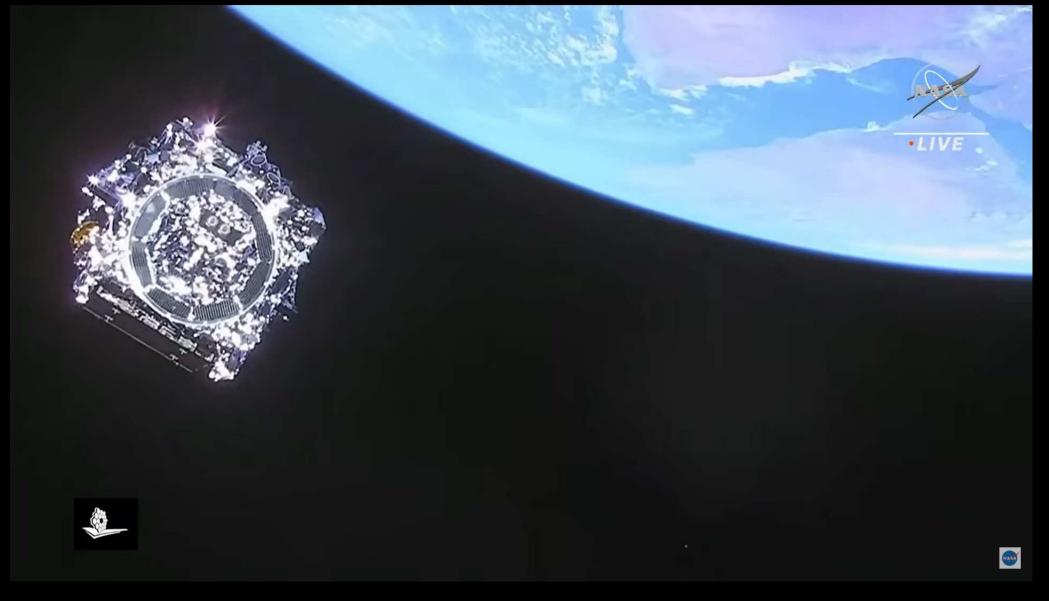

Sept. 2021: JWST ready and stowed for shipping to Kourou

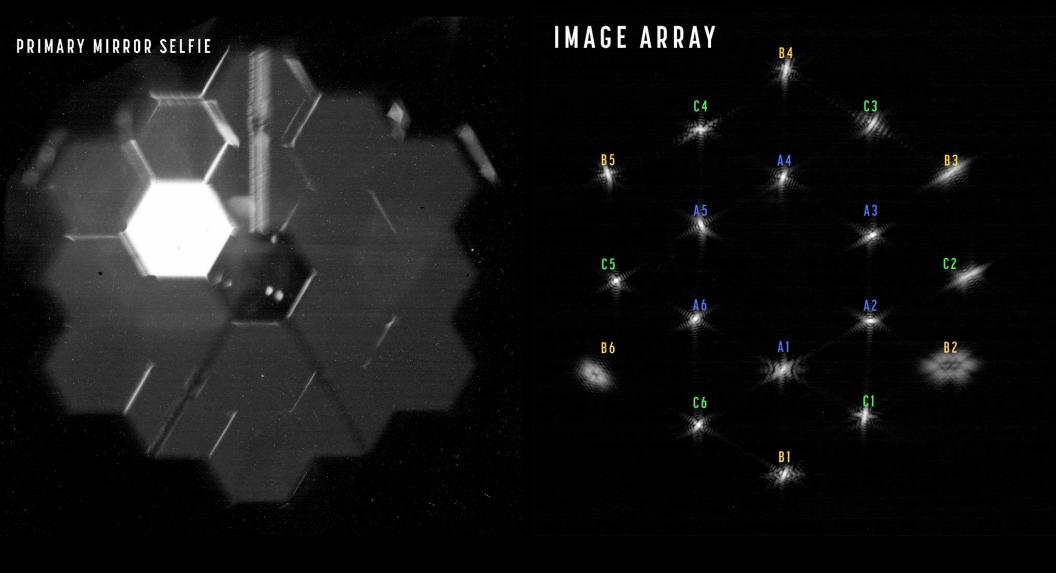

Dec. 9, 2021: JWST transport in Kourou to Ariane Rocket Assembly Building

Webb is finally launched from Kourou on December 25, 2021!

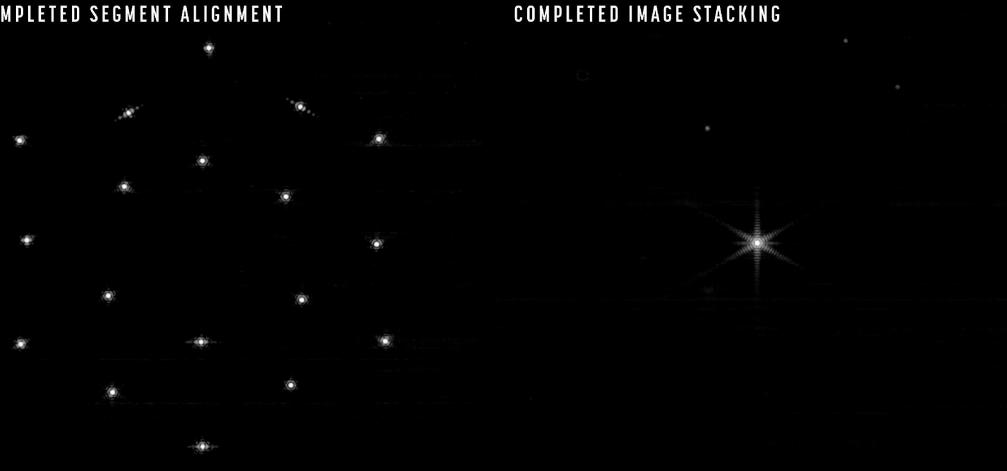

Feb. 2022: Webb seen shortly after launch over Africa using the Ariane V camera.

Feb. 2022: Webb's first selfie (left) and First Light raw image (right).

Webb's first segment alignment (left) and first image stack (right).

(2) WFC3: Hubble's new Panchromatic High-Throughput Camera

HST WFC3 and its IR channel: a critical pathfinder for JWST science.

(2) Hubble WFC3: Measuring Galaxy Assembly and SMBH Growth?

10 filters with Hubble WFC3 & ACS reaching AB=26.5-27.0 mag over 40 arcmin² with 0.07–0.15" images from 0.2–1.7 μ m (UVUBVizYJH). JWST adds 0.05–0.2" FWHM imaging to AB \simeq 31.5 mag (1 FF) at 1–5 μ m, with 0.2–1.2" images at 5–29 μ m, tracing young+old stars & dust.

Black Hole growth — Waves that happen in Nature: 1) Sounds Waves:

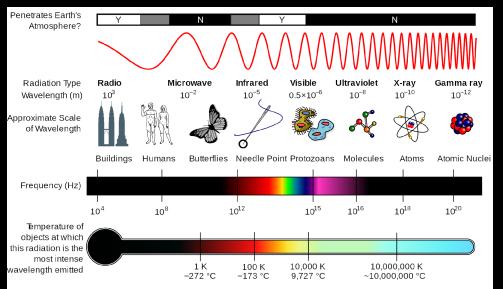

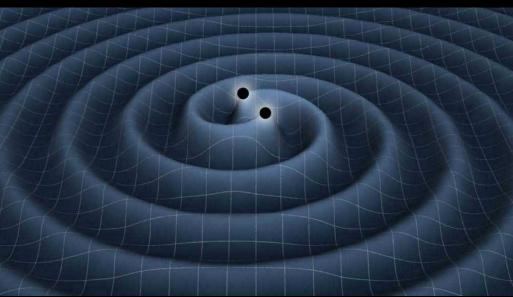

In solids: Earthquakes

In liquids: Surf!

In gasses: Sound

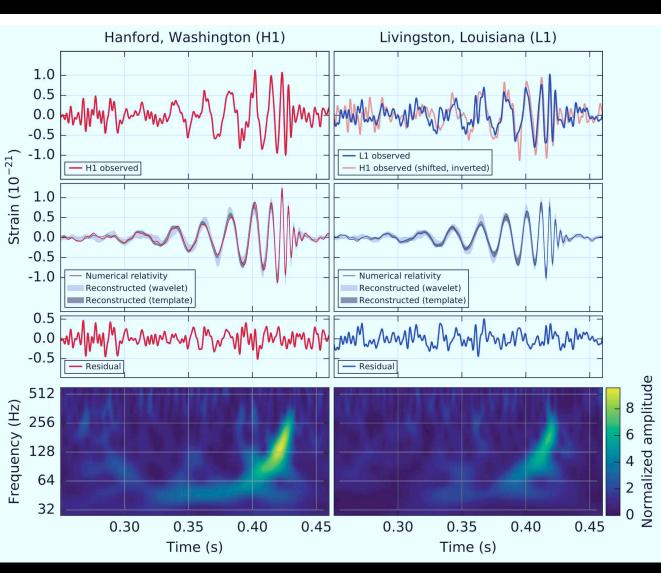

2) Electromagnetic Waves

3) In space-time: Gravity Waves

Sept. 2015: LIGO added Gravity Waves as a new way to observe Nature!

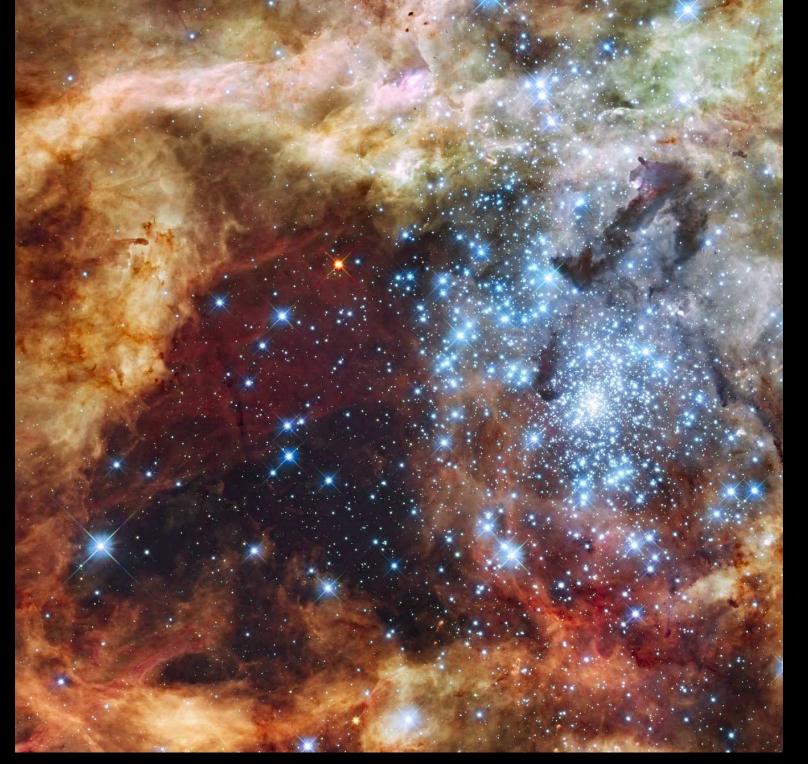

(1) LIGO first observed Gravitational Waves on Sept. 14, 2015.

(2) These were caused by two merging (29+36) M_{\odot}) black holes about 1 Gyr ago!

• $E=Mc^2$: 3 M_{\odot} was converted to energy in a fraction of a second!

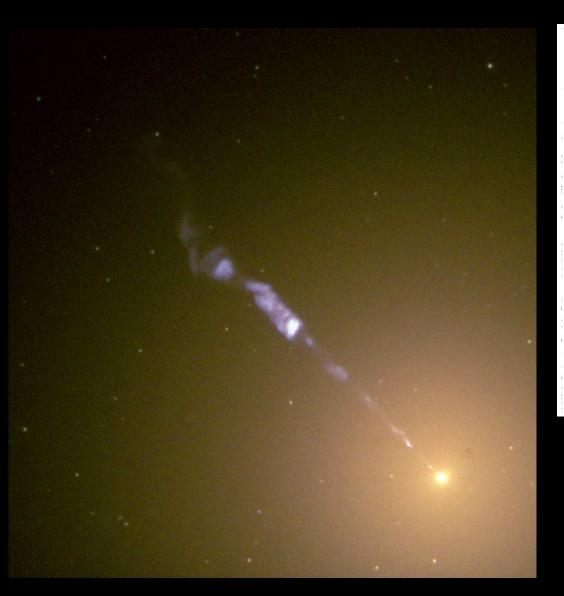

Ordinary massive stars (10–30 M_{\odot}) leave modest black holes (~3–10 M_{\odot}).

Conclusion 1: Most low-mass black holes today are small, slow eaters:

- 29–36 M_{\odot} blackholes may be leftover from First Stars (first 500 Myr).
- Likely too massive to be leftover from ordinary Supernova explosions, ...
- How come only now seen merging by LIGO (12.5 Byr after BB)?
- They were likely not fast & efficient eaters, but slow and messy ...

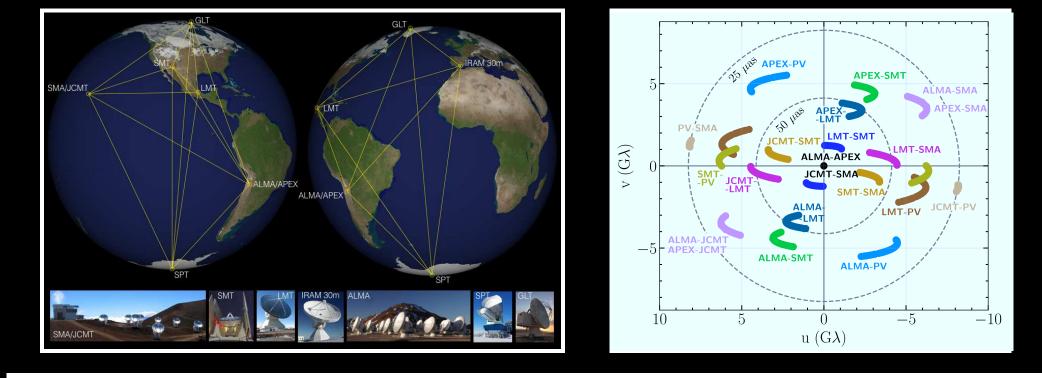

Elliptical galaxy M87 with Active Galactic Nucleus (AGN) and relativistic jet:

"For God's sake, Edwards. Put the laser pointer away."

The danger of having Quasar-like devices too close to home ... They are EXTREMELY bright sources if viewed "down-the-pipe". $\sim 0.5\%$ of the baryonic mass, but produce most of the photons!

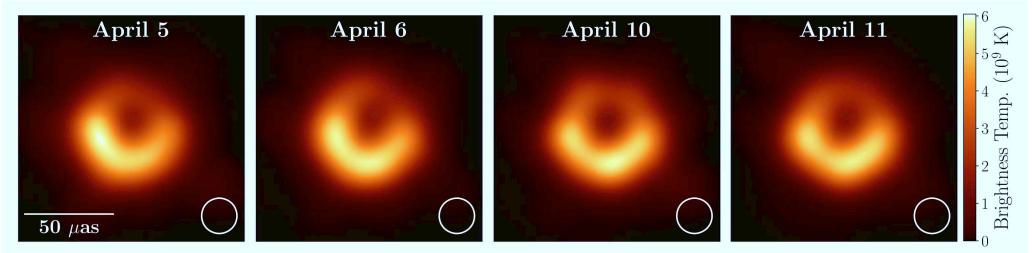

Figure 15. Averages of the three fiducial images of M87 for each of the four observed days after restoring each to an equivalent resolution, as in Figure 14. The indicated beam is 20 μ as (i.e., that of DIFMAP, which is always the largest of the three individual beams).

2019 discovery of Black Hole Shadow in M87 by Event Horizon Telescope: M87 at 55 Mlyr distance has a black hole mass of $\sim 6.5 \times 10^9 \ M_{\odot}!$

3000 light-years 1400 parsecs

56″

• Quasars: Centers of galaxies with feeding supermassive blackholes:

• Hubble IR-images of the most luminous Quasar known in the universe.

- Seen at redshift 6.42 (universe 7.42× smaller than today), 900 Myr old!
- Contains 10^{14} solar luminosities within a region as small as Pluto's orbit!
- A feeding monster blackhole ($>3 \times 10^9$ solar mass) 900 Myr after BB!

Conclusion 2: Supermassive black holes started early & were very rapid eaters:

• Massive galaxies today contain a super-massive blackhole, no exceptions!

- Masses $\sim 3 \times 10^9$ solar, leftover from the First Stars (first 500 Myr)?
- Must have fed enormously rapidly in the first 1 Byr after the Big Bang.
- Were eating *cat*-astrophically (and secretly) until they ran out of food ...
- JWST can image the First Quasars to $z\gtrsim 10$ (*if* we can find them).

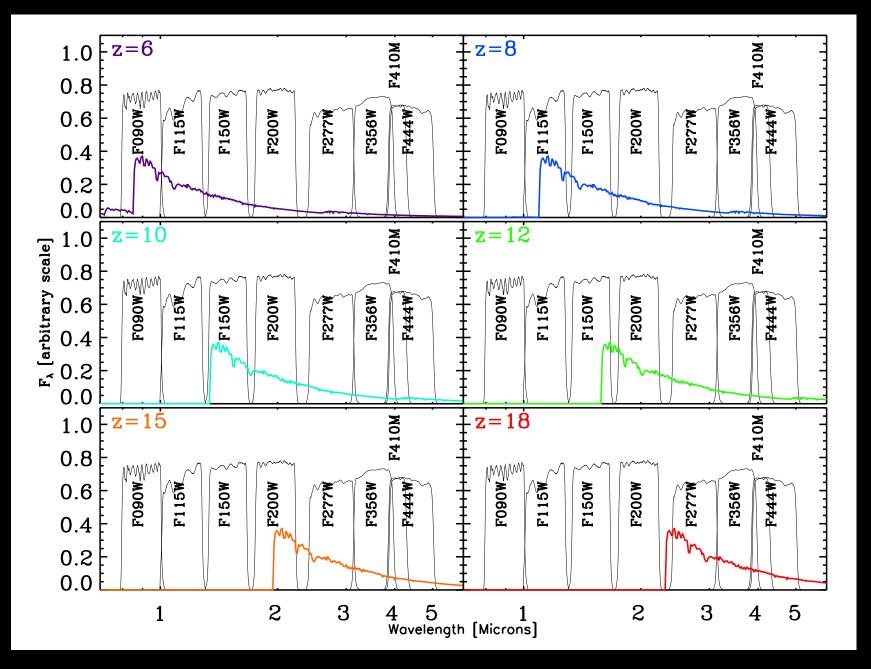

Will this ever happen to our own Galaxy?

YES! Hubble showed no lateral motion of Andromeda: Approaches at -110 km/s. Hence, Andromeda will merge with Milky Way! The two blackholes $(10^6 - 10^7)$ suns) will also merge! Not to worry: only 4-5 Byr from today!

Illustration Sequence of the Milky Way and Andromeda Galaxy Colliding

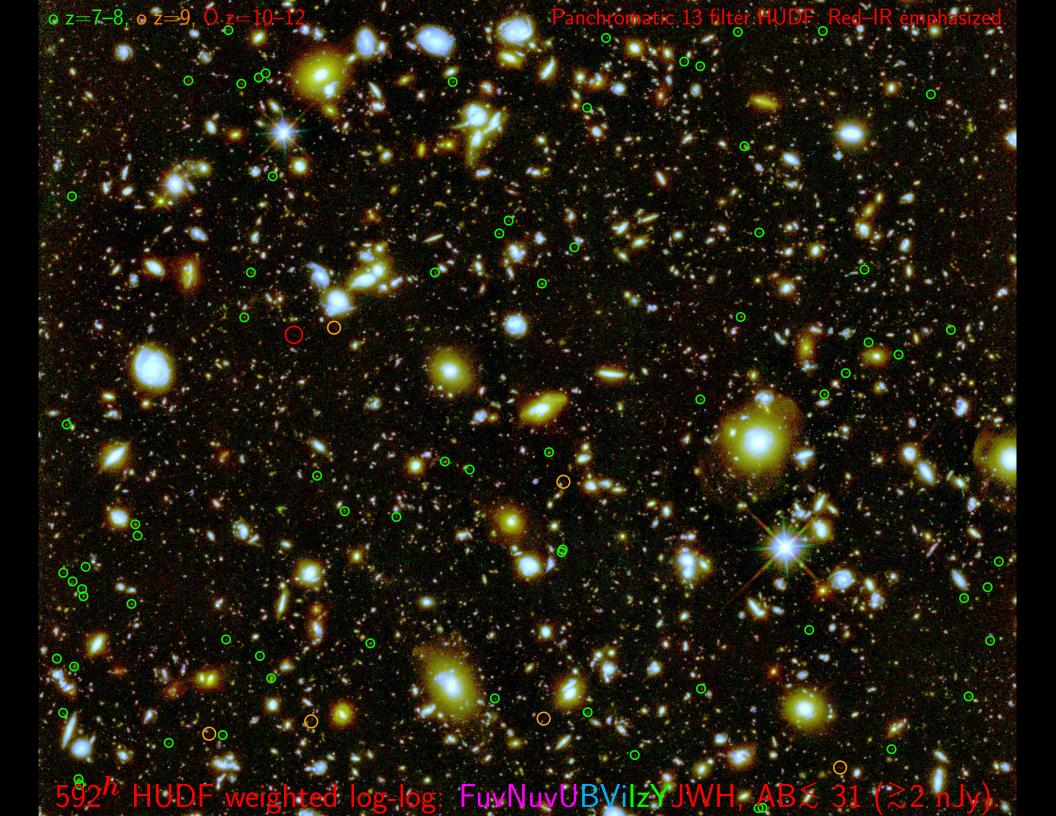

NASA, ESA, Z. Levay and R. van der Marel (STScl), T. Hallas, and A. Mellinger - STScl-PRC12-20b

• Can't beat redshift: to see First Light, must observe near–mid IR. \Rightarrow This is why JWST needs NIRCam at 0.8–5 μ m and MIRI at 5–28 μ m. The HST-unique part for JWST: Panchromatic 13 filter HUDF: UV-Blue emphasized.

592^{*h*} HUDF weighted log-log: FuvNuvUBViIzYJWH, AB \lesssim 28–31 (\gtrsim 2 nJy).

Panchromatic 13 filter HUDF.

Felse-color "Bolometric" or χ^2 unlige

6

841 orbits = 592^k HUDF AB \$31 mag, Objects affect ~45% of pixelsU

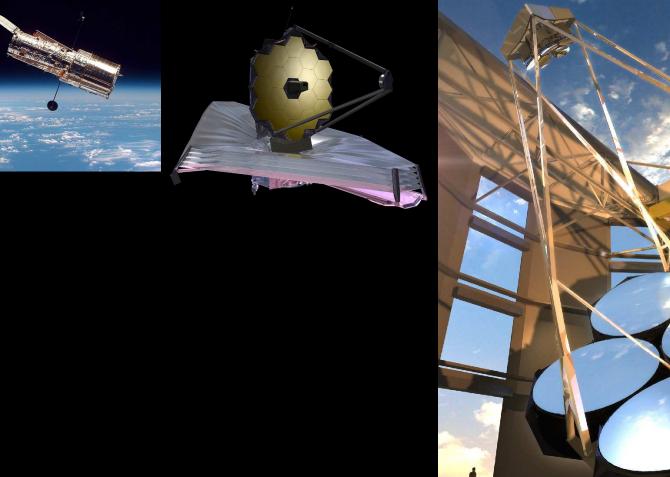

HST Frontier Field A2744: JWST needs lensing to see First Light at $z\gtrsim$ 11–15.

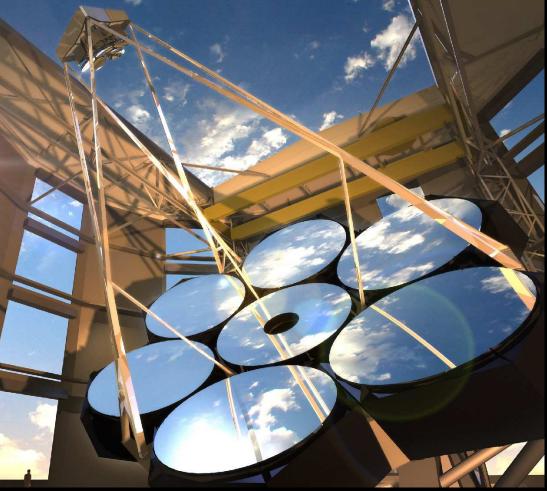

Conclusion: JWST First Light strategy must consider three aspects:

- (1) The catastrophic drop in the object density at $z\gtrsim 8$ ($\lesssim 0.5$ Gyr).
- (2) Cannot-see-the-forest-for-the-trees effect ["Natural Confusion" limit]: Background objects blend into foreground because of their own diameter.
- (3) House-of-mirrors effect ["Gravitational Confusion"]:
- JWST needs to find most First Light objects at $z\gtrsim 10-15$ through the best cosmic lenses (this will make the images even more crowded):
- Lensing is needed to see what Einstein thought was impossible to observe!

(4) Future: Next generation 20–40 m ground-based telescopes and ATLAST True relative size: Hubble, James Webb, & Giant Magellan Telescope

 $(1973 \sim 2020^+);$ $(1996 \sim 2031);$

 $(2000 \sim 2050^+).$

- JWST has superbly dark L2-sky & SB-sensitivity, and stable PSF.
- GMT has $4 \times$ higher Res (AO), high-Res spectra, long-term time-domain.

(4) Future: Next generation 20–40 m ground-based telescopes and ATLAST True relative size: Hubble, James Webb, and ATLAST ...

 $(1973 \sim 2020^+);$ $(1996 \sim 2031);$

 $(2020 \sim 2050^+?).$

(4) Future: How can we knock it out of the ball-park in the next 30 years?

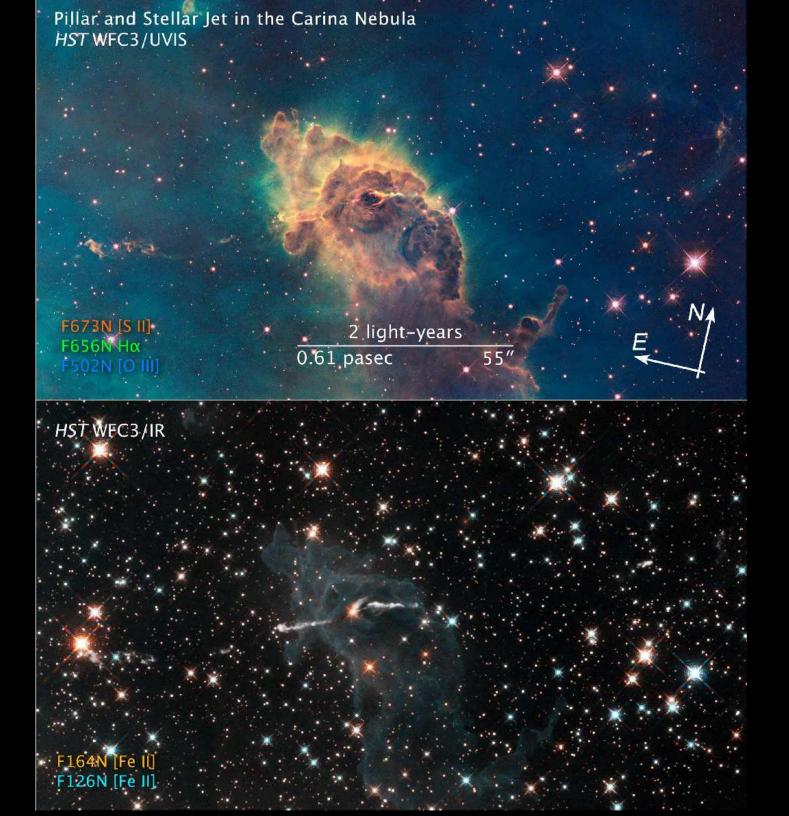

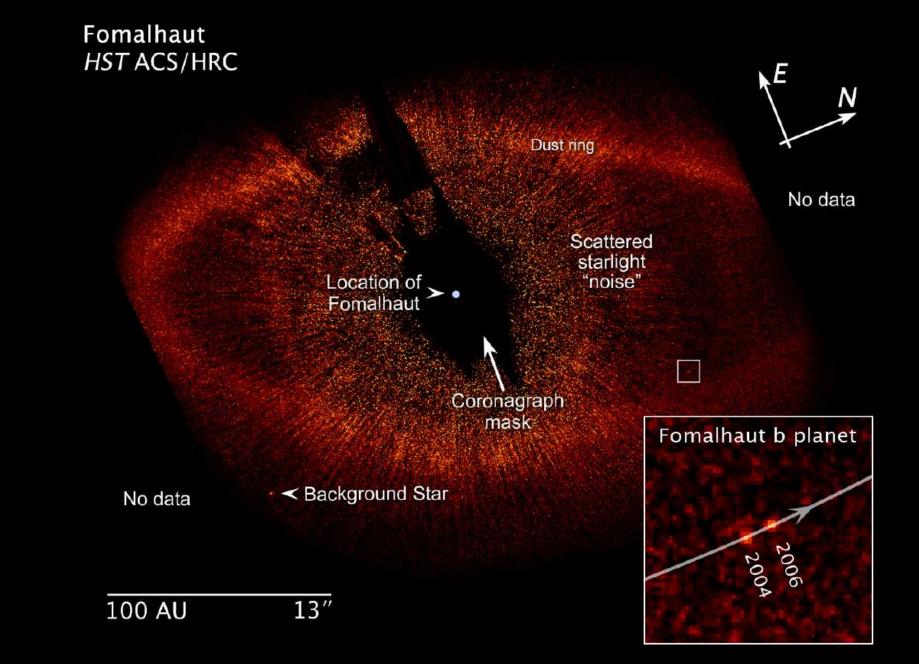

Each of GMT and ATLAST facility nearly fills the whole Yankee ballpark ...
New paradigm: They are too large for an individual university to take on.
Universities need to collaborate nation-wide to make this happen.

(5) How can JWST measure Star-Formation and Earth-like exoplanets?

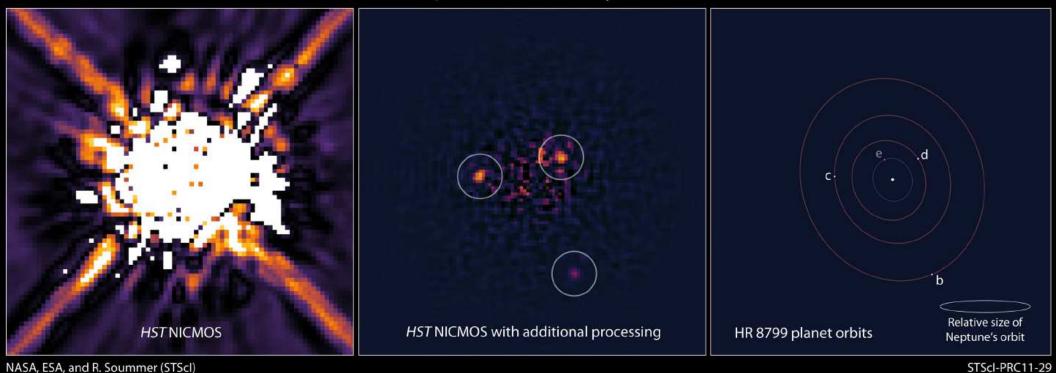

NGC 3603: Young star-cluster triggering star-birth in "Pillars of Creation"

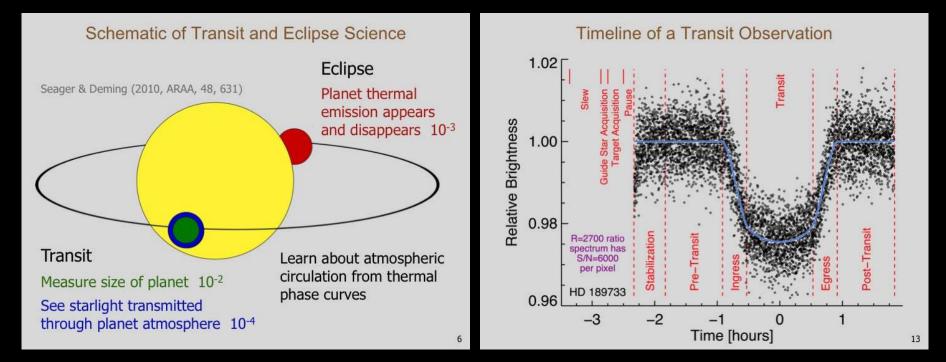

HST/ACS Coronagraph imaging of planetary debris disk around Fomalhaut: First direct imaging of a moving planet forming around a nearby star! JWST can find such planets much closer in for much farther stars.

Exoplanet HR 8799 System

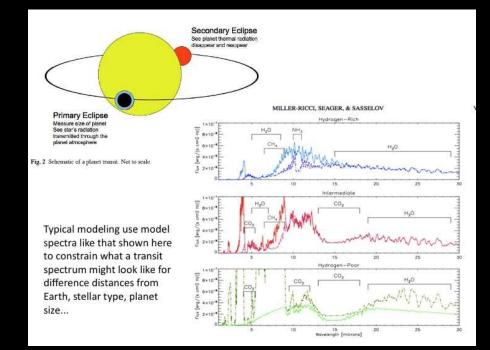

HST/NICMOS imaging of planetary system around the (carefully subtracted) star HR 8799: Direct imaging of planets around a nearby star. Press release: http://hubblesite.org/newscenter/archive/releases/2011/29/

JWST can find such planets much closer in for much farther-away stars.

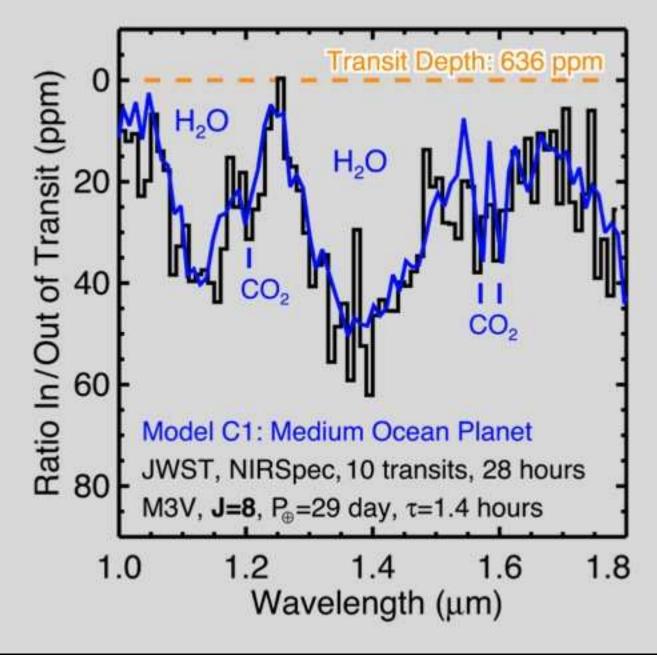

JWST can do very precise photometry of transiting Earth-like exoplanets.

JWST IR spectra can find water and CO_2 in (super-)Earth-like exoplanets.

Transit Spectrum of Habitable "Ocean Planet"

JWST IR spectra can find water and CO_2 in transiting Earth-like exoplanets.

STScI-PRC09-32b

30 Doradus: Giant young star-cluster in Large Magellanic Cloud (150,000 ly), triggering birth of Sun-like stars (and surrounding debris disks).

(6) Summary and Conclusions

(1) HST set stage to measure galaxy assembly in the last 12.7-13.0 Gyrs.

(2) JWST passed Preliminary & Critical Design Reviews in 2008 & 2010.Management replan in 2010-2011. No technical showstoppers thus far:

• 100% of JWST H/W built, & meets/exceeds specs. Final I&T.

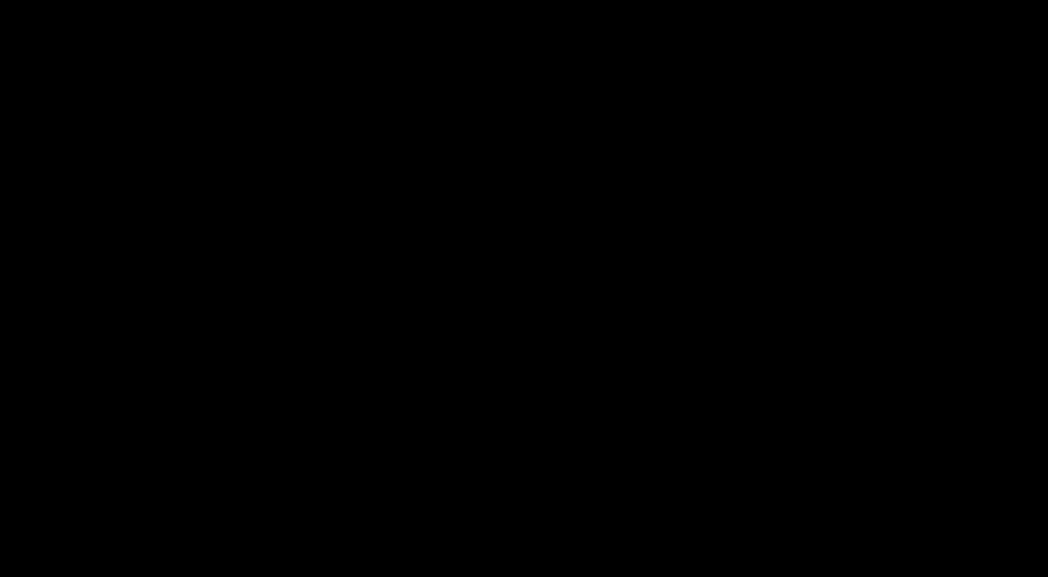

(3) JWST is designed to map the epochs of First Light, Reionization, and Galaxy Assembly & SMBH-growth in detail. JWST will determine:

- Formation and evolution of the first star-clusters after 0.2 Gyr.
- How dwarf galaxies formed and reionized the Universe after 1 Gyr.

(4) JWST will have a major impact on astrophysics this decade:

- IR sequel to HST starting 2022: Training next generation researchers.
- JWST will define the next frontier to explore: the Dark Ages at $z\gtrsim 20$.

What the Scientists See:

What the Project Manager Sees:

The Happy Balance

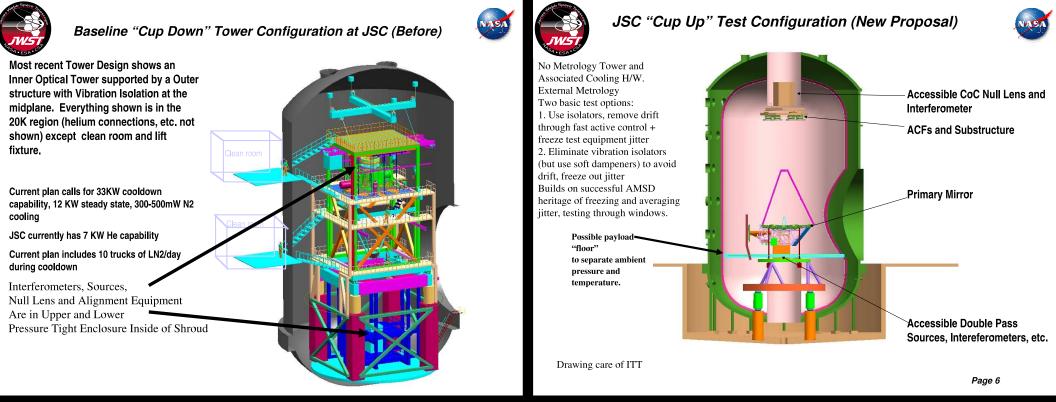

Any (space) mission is a balance between what science demands, what technology can do, and what budget & schedule allows ... (courtesy Prof. R. Ellis).

• (7) Update of JWST programmatics as of 2022

Northrop Grumman Expertise in Space Deployable Systems

- Over 45 years experience in the design, manufacture, integration, verification and flight operation of spacecraft deployables
- 100% mission success rate, comprising over 640 deployable systems with over 2000 elements

JWST underwent several significant replans and risk-reduction schemes:

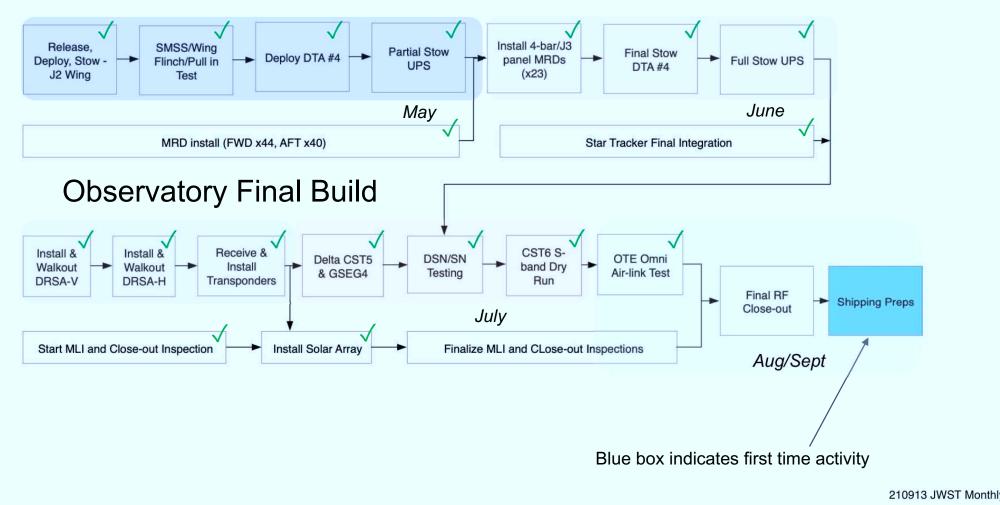

- \lesssim 2003: Reduction from 8.0 to 7.0 to 6.5 meter. Ariane-V launch vehicle.
- 2005: Eliminate costly 0.7-1.0 μ m performance specs (kept 2.0 μ m).
- 2005: Simplification of thermal vacuum tests: cup-up, not cup-down.
- 2006: All critical technology at Technical Readiness Level 6 (TRL-6).
- 2008: Passes Mission Preliminary Design & Non-advocate Reviews.

• 2010, 2011: Passes Mission Critical Design Review: Replan Int. & Testing.

• 2017–2018: Replan final Integration & Testing \Rightarrow Dec. 2021 launch.

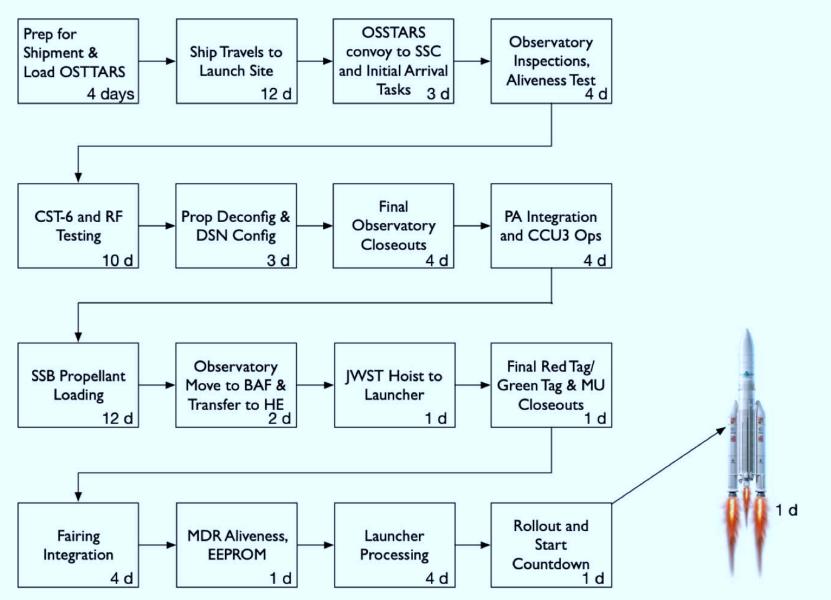

Remaining I&T Steps

Observatory Deployments

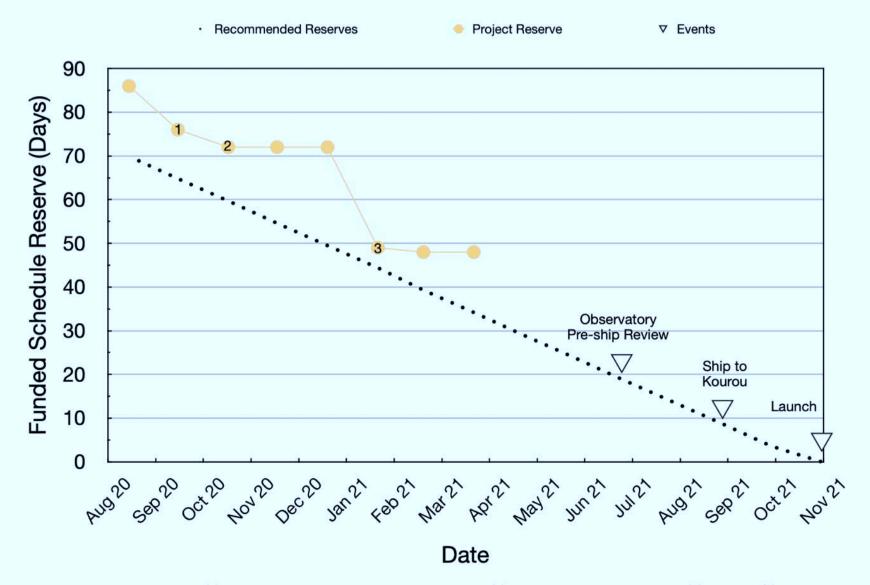

Flowchart of Project tasks for FY21. Blue = First-time operation (all others done before at sub-system level).

Kourou Activities

Flowchart of ESA and Project tasks at Kourou (French Guyana).

Current Funded Schedule Reserve

Reserve uses: (1) Bldg M4 issues, additional Z-axis vibe run, (2) Ka-band measurements, APCO adapter (3) Planned sunshield repairs and patching

Project reserves in Spring 2021 for launch in Dec. 2022.

210809 JWST Monthly Telecon 3

Milestones left to go as of Summer 2021.

Operational Readiness Review passed in Aug. 2021.

Milestone Performance

• Since the September 2011 replan JWST reports high-level milestones monthly to numerous stakeholders

	Total Milestones	Total Milestones Completed	Number Completed Early	Number Completed Late	Deferred to Next Year	Deferred more than one quarter
FY2011	21	21	6	3	0	0
FY2012	37	34	16	2	3	3
FY2013	41	38	20	5	3	2
FY2014�	36	23	10	8	11	10
FY2015	48	44	22	12	4	3
FY2016	45	39	25	7	6	2
FY2017	38	32	12	13	8	5
FY2018	31	18	7	2	13	13
FY2019	25	19	8	9	2	1

Milestone accounting in FY2014 was complicated by the government shutdown and multicomponent milestones

190909 JWST Monthly Telecon 5

Δ

FY14: 8 milestones late by 1 mo due to Oct 2013 Government shutdown. FY15: Most "Lates" not on critical path.

FY17: Lates started to outnumber Early's \Rightarrow Replan Integration & Testing.

Commissioning At A Glance

Commissioning begins at launch and is ~180 days long, including the following key events:

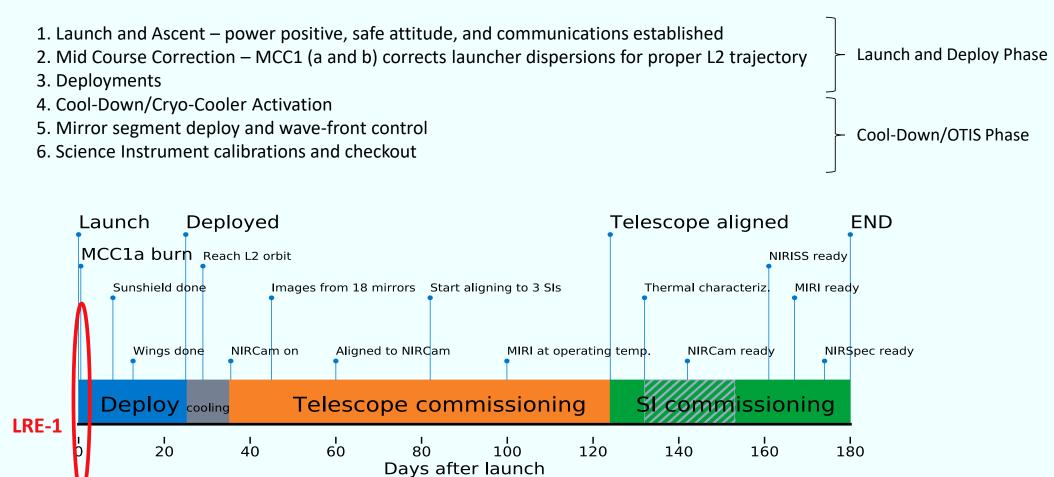

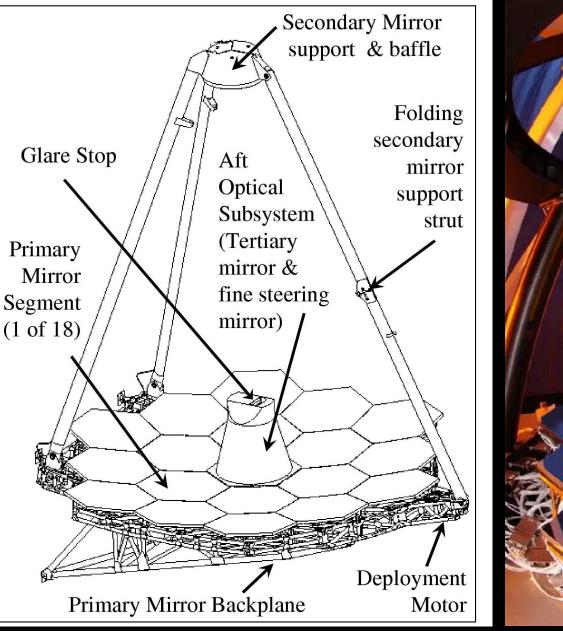

Image credit: NASA/ Jane Rigby

201109 JWST Monthly

JWST Commissioning Plan after launch from Kourou in Dec. 2021.

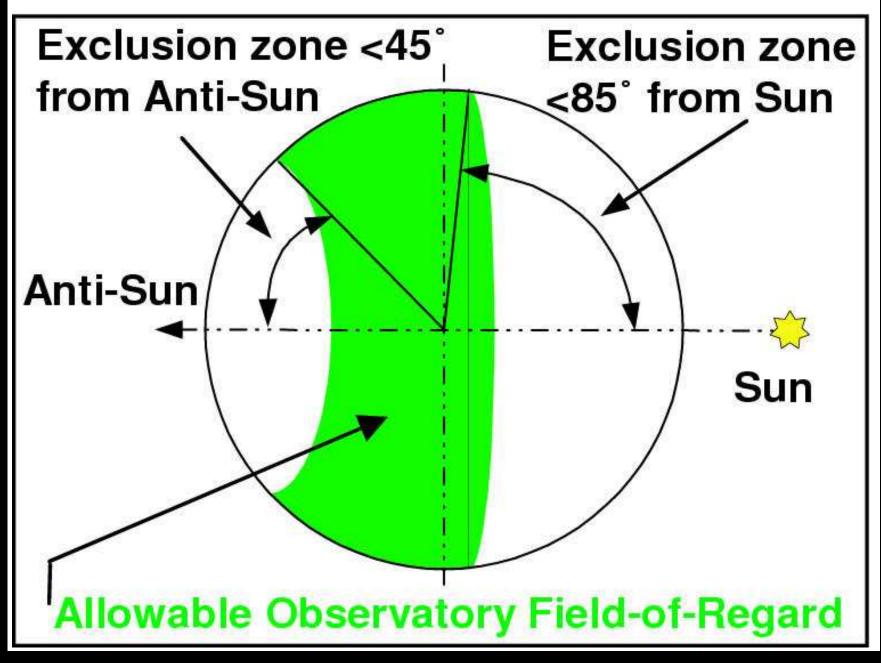

First light NIRCam	After Step 1	Initial Capture	Final Condition
1. Segment Image Capture	* * * * * * * * * * * * * * * * * *	18 individual 1.6-m diameter aberrated sub-telescope images PM segments: < 1 mm, < 2 arcmin tilt SM: < 3 mm, < 5 arcmin tilt	PM segments: < 100 μm, < 2 arcsec tilt SM: < 3 mm, < 5 arcmin tilt
2. Coarse Alignment Secondary mirror aligned Primary RoC adjusted	After Step 2	Primary Mirror segments: < 1 mm, < 10 arcsec tilt Secondary Mirror : < 3 mm, < 5 arcmin tilt	WFE < 200 μm (rms)
3. Coarse Phasing - Fine Guiding (PMSA piston)	After Step 3	WFE: < 250 μm rms	WFE <1 µm (rms)
4. Fine Phasing	After Step 4	WFE: < 5 μm (rms)	WFE < 110 nm (rms)
5. Image-Based Wavefront Monitoring	After Step 5	WFE: < 150 nm (rms)	WFE < 110 nm (rms)

JWST's Wave Front Sensing and Control is similar to the Keck telescope. In L2, need WFS updates every 10 days depending on scheduling/illumination.

Wave-Front Sensing tested hands-off at 40 K in 1-G at JSC in 2015–2017. Ball 1/6 scale-model for WFS: produces diffraction-limited 2.0 μ m images.

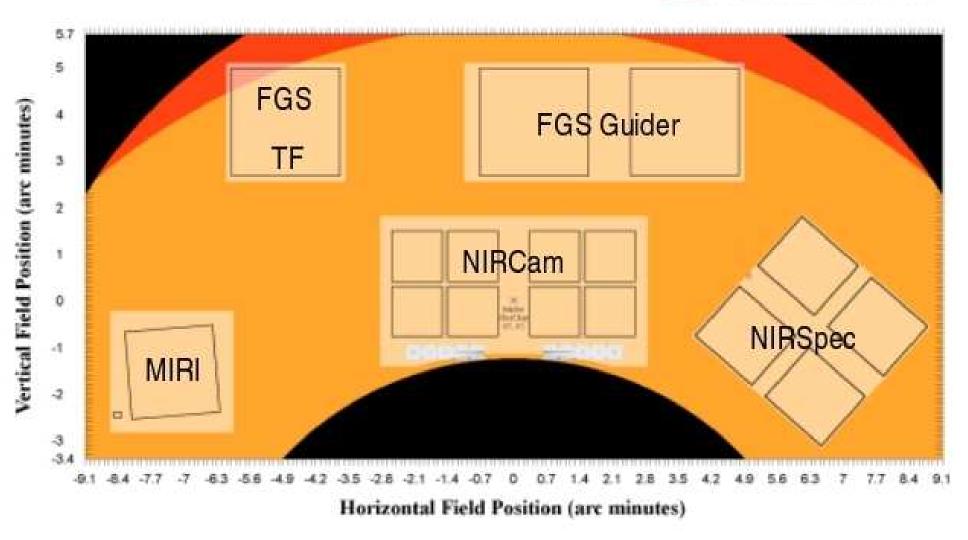

JWST can observe North/South Ecliptic pole targets continuously:

- 1000-hr JWST projects swap back/forth between NEP/SEP targets.
- JWST gets the very best reaction wheels (Rockwell Collins; Heidelberg).

• What instruments will JWST have?

Solution = 131 nm RMS OTE wavefront error ≤ 150 nm RMS OTE wavefront error

All JWST instruments can in principle be used in parallel observing mode:
Currently only being implemented for parallel *calibrations*.

(8) What do our Astrophysics College Graduates do? Future Careers at NASA:

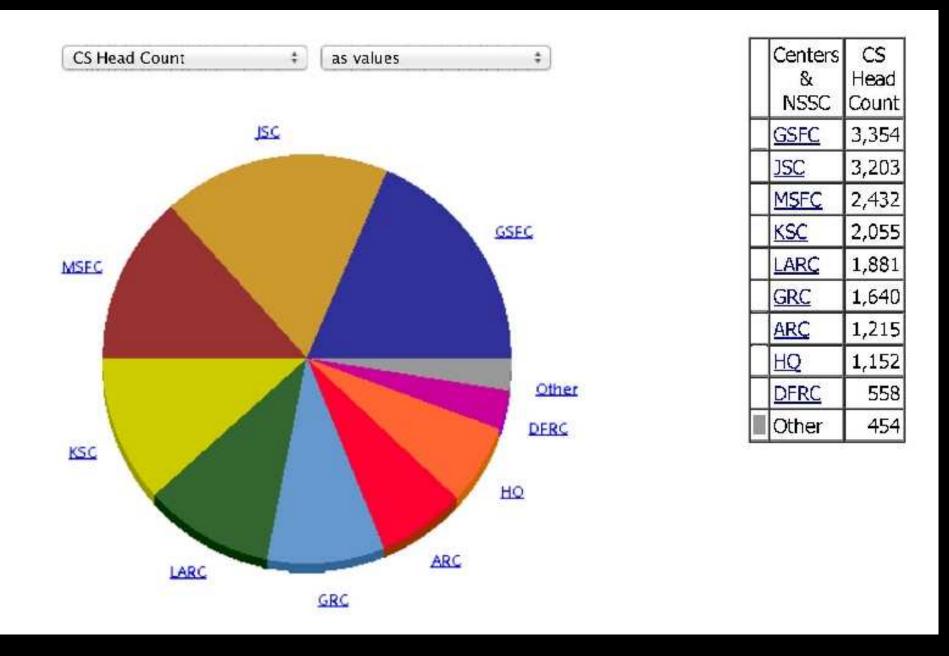

- Over the last 25 years, (ASU) Astrophysics College Graduates typically:
- (0) Have very low unemployment (\lesssim few %).
- (1) About 30% are faculty at Universities or 4-year colleges.
- (2) About 30% are researchers at NASA or other government centers.
- (3) About 20% work in Aerospace or related industries.
- (4) About 20% are faculty at Community Colleges or Highschools.
