Powered Industrial Truck Program

IAW 29CFR1910.178
Powered Industrial Trucks

December 2019
Overview

Material handling is a significant safety concern. During the movement of products and materials, there are numerous opportunities for injuries and property damage. Powered industrial trucks, or PIT, better known as forklifts, pallet jacks and stand-up riding reach trucks are essential tools in handling materials. This document has been created to minimize the risk of injury to operators, bystanders, and to avoid damaging university property. Departments assigned this equipment will utilize this program to increase operator awareness of recognized safety standards. Qualified trainers will be used to provide all training activities. Written records will be kept in the respective departments and by Environmental Health and Safety, or EHS, to document all training. Specific responsibilities for monitoring the effectiveness of this program are assigned to departments, supervisors, operators, and EHS.

Scope and application

This program has been developed to reduce the risk of physical injury or property damage in areas where PIT are in operation. It also brings the university into compliance with federal, state, and local law. This program applies to the operation of all PIT, forklifts, tractors, platform lift trucks, motorized hand trucks, and other specialized industrial trucks powered by electric motors or internal combustion engines by university employees and contractors, engaged in university projects.

Departments assigned PIT must ensure that supervisors and operators comply with all aspects of this safety program. All university employees must successfully complete this training program, and receive certification prior to the operation of any PIT. Contractors operating PIT on university projects are expected to meet or exceed the requirements found in this program, and comply with all applicable statues and regulations governing the use of powered industrial trucks.

Roles and responsibilities

EHS responsibilities

The overall responsibility to develop and implement occupational health and safety programs for the university falls with EHS. Although it is the overall responsibility of EHS to develop these programs, it is ultimately up to each department or unit supervisor to ensure that employees are provided the vital support and means to adequately carry out the provisions of each program and achieve regulatory compliance with all OSHA requirements. Responsibilities of EHS related to PIT includes:

- Develop, implement and administer the Arizona State University PIT program and written plan.
• Evaluate designated areas for forklift use.
• Identify atmospheric hazard classification where combustion engines PIT are used to ensure and to determine the need for additional monitoring and/or the choice of appropriate PIT.
• Inspect work areas and equipment when notified to provide the user training and to ensure safe operator practice is implemented and adhered to.
• Maintain training records of all PIT operators.
• Monitor the effectiveness of program by receipt of copies of inspection checklists.
• Observe the operation of powered industrial trucks, and report unsafe practices to the appropriate supervisor.
• Provide orientation and initial training as requested by university departments
• Provide recommendations concerning the choice of PIT.
• Provide the technical expertise and training necessary to identify safe operator practices and equipment where PIT are used.
• Review the PIT program as necessary for compliance and effectiveness.

Departments assigned PIT for forklifts

• Maintain written records of operator training on each model of a PIT and the name of the trainer.
• Maintain written records of the frequent and annual inspections performed by the Powered Industrial Truck owner, including the date any problems found, the date when fixed, and the name of the person performing the repairs.
• Maintain written records of the inspections performed by the PIT owner, including the date any problems found, the date when fixed, and the name of the person performing the repairs.
• Make recommendations for revisions if necessary.
• Must implement and administer the PIT program.
• Verify that all employees who operate or work near PIT are properly trained.

Supervisors

• Coordinate employee training, and certify that all operators receive refresher training every three years.
• Ensure no one under the age of 18 operates PIT.
• Ensure that only trained and qualified individuals use powered industrial trucks.
• Observe the operation of powered industrial trucks in your department, and correct unsafe practices.
• Prohibit operator to utilize a PIT who is involved in a PIT incident until refresher training is completed.
• Provide specific operational training for each forklift in their department.
• Verify employee compliance with the principles and practices outlined in the FOSP.
Operators

- Attend refresher training every three years.
- Complete the Daily Pre-Use Inspection Checklist before operating any powered industrial truck.
- Complete the Forklift Safety Program.
- Observe the operation of powered industrial trucks in your department, and report unsafe practices to your supervisor.
1. **Mast**: the mast is the vertical assembly on the front of the forklift that does the work of raising, lowering, and tilting the load. Most masts are ‘three stage’ meaning there are three channels on each side.
2. **Lift chain**
3. **Lift Cylinder**: The amount of vertical lift, which is raised or lowered of the mast, forks and carriage are controlled by the hydraulic lift cylinder.
4. **Back rest**: The load backrest is designed to keep the load from falling toward the driver. The load rests against a flat surface and allows for safe loading and unloading.
5. **Fork carriage**: The carriage mounts the forks to the mast and serves as a support structure for the forklift.
6. **Fork**: The forks are long extensions (like arms) that are attached to the carriage. They are used to support the load from the bottom. They come in a variety of widths and adjust from right to left on the carriage.
7. **Head Lamp**
8. **Turn signal Lamp**
9. **Overhead guard**: The overhead guard is the frame around the cab of the forklift. It prevents large objects from falling onto the driver. Since the overhead guard is a grate design, it does not prevent smaller objects from falling from elevated heights. A sheet of steel or heavy-duty clear plastic can be attached to the overhead guard as an added layer of protection.
10. **Counterweight**: The counterweight is located at the back of the forklift and is installed by the manufacturer. It prevents the forklift from tilting forward when it is loaded.
11. **Tilt Cylinder**: The amount of forward and backward tilt of the mast, forks and carriage are controlled by the tilt cylinder.
Procedures

Pre-use inspection

- Any safety defects (such as hydraulic fluid leaks; defective brakes, steering, lights, or horn; and/or missing fire extinguisher, lights, seat belt, or back-up alarm) must be reported for immediate repair. The forklift shall be locked and tagged, and taken out of service until repairs have been made.
- Prior to the operation of any forklift a visual inspection shall be completed. This applies at the beginning of every work period, and whenever a new equipment operator takes control of the forklift.

Operation

- A load backrest extension must be used whenever necessary to minimize the possibility of the load or part of it from falling rearward.
- A safe distance must be maintained from the edge of ramps or platforms while on any elevated dock, platform, or freight car. Trucks must not be used for opening or closing freight doors.
- All forklifts shall be equipped with a multi-purpose dry chemical fire extinguisher.
- All modifications must be approved by the manufacturer, and new rated load capacities determined and posted on the forklift. Written approval is required.
- An overhead guard must be used as protection against falling objects.
- Arms or legs may not be placed between the uprights of the mast or outside the running lines of the truck.
- Forklifts must not be driven up to anyone standing in front of a fixed object.
- If forklifts are used to elevate persons then an appropriate man lift platform – cage with standard rails and toe-boards – that is attached to the mast shall be approved by the manufacturer.
- Lift capacity must be marked on all forklifts. Operators must assure the load does not exceed rated weight limits.
- Maintain sufficient headroom under overhead installations such as: lights, pipes, sprinkler systems, etc.
- Operators must report all incidents/near misses, regardless of fault and severity, to their supervisor.
- Operators must sound the horn and use extreme caution when meeting pedestrians, making turns, and cornering.
- Operators must wear hard hats in areas where overhead hazards exist.
- Operators must wear seatbelts at all times.
- Passengers are not allowed to ride on an industrial truck, unless the truck has an extra seat that allows the passenger to buckle-up while riding.
- Persons are not allowed to stand or pass under any elevated portion of a truck.
- Rail cars and trailers must be parked squarely to the loading area and have wheels chocked in place. Operators must follow established docking/undocking procedures.
• Travel-ways must be maintained free from obstructions, aisles must be marked, and wide enough (six-foot minimum) for vehicle operation.
• When a forklift is left unattended (more than 25ft. away or out of sight), load engaging means must be fully lowered, controls neutralized, power shut off, and brakes set. Wheels must be blocked if the truck is parked on an incline.

Loading

• A load engaging means must be placed under the load as far as possible. The mast must be carefully tilted backward to stabilize the load.
• Loads should be safely arranged, stable, and centered – always use caution when handling loads. Adjust long or high (including multiple-tiered) loads that may affect capacity.
• Only handle loads within the rated capacity of the truck.
• Trucks equipped with attachments must be operated as partially loaded trucks even when not handling a load.
• Use extreme care when tilting the load forward or backward, particularly when high tiering. Tilting forward with load engaging means elevated is prohibited except to pick up a load. An elevated load may not be tilted forward except when the load is in a deposit position. When stacking or tiering, use only enough backward tilt to stabilize the load.

Traveling

• A safe distance must be maintained, approximately three truck lengths from the truck ahead, and the trucks must be kept under control at all times.
• All traffic regulations must be observed, including authorized speed limits and yielding to pedestrians.
• Avoid running over loose objects on the roadway surface.
• Do not pass other forklifts traveling in the same direction at intersections, blind spots, or other dangerous locations.
• Dock board or bridge plates must be driven over carefully and slowly and their rated capacity never exceeded.
• Dock board or bridge plates must be properly secured before they are driven over.
• Grades must be ascended and descended slowly. Position the load uphill relative to the operator when ascending or descending grades.
• If the load being carried obstructs forward view, the driver must travel with the load trailing.
• Loads must be tilted back and carried no more than four to six inches above the ground.
• Railroad tracks must be crossed diagonally wherever possible. Parking closer than eight feet from the center of railroad tracks is prohibited.
• Stunt driving and horseplay are prohibited.
• The driver must look in the direction of and keep a clear view of the path of travel.
• The driver must slow down and sound the horn at cross aisles and other locations where vision is obstructed.
• The right of way must be yielded to ambulances, fire trucks, or other vehicles in emergency situations.
• When loading rail cars and trailers, dock plates must be used.
• While negotiating turns, reduce speed and turn the hand steering wheel in a smooth, sweeping motion. Except when maneuvering at a very low speed, the hand steering wheel must be turned at a moderate, even rate.

Fueling – appropriate personal protective equipment, or PPE shall be worn
• Contact EHS Environmental Affairs for proper disposal of any spill clean-up debris.
• Fuel tanks may not be filled while the engine is running. Avoid spillage.
• LPG is cold and can cause thermal burns, use the appropriate gloves and eye protection.
• No truck can be operated with a leak in the fuel system.
• Open flames are not to be used when checking electrolyte levels in storage batteries, or gasoline levels in fuel tanks.
• Shut off the engine while refueling and set the parking brake and put the controls in neutral.
• Spillage of oil or fuel must be absorbed using oil dry or vermiculite, the affected area carefully washed, and the fuel tank cap replaced before restarting engine.

Changing/charging storage batteries - appropriate PPE shall be worn
• A carbon filter or siphon must be provided for handling electrolyte.
• A conveyor, overhead hoist, or equivalent material handling equipment must be provided for handling batteries.
• Battery charging installations must be located in areas designated for that purpose.
• Care must be taken to assure that vent caps are functioning. The battery (or compartment) cover(s) must be open to dissipate heat.
• Distracted operating such, but not limited to, cell phone use is prohibited.
• Employees charging and changing batteries shall be authorized to do the work, trained in the proper handling, and required to wear protective clothing, including face shields, long sleeves, rubber boots, aprons, and gloves.
• Facilities must provide for: flushing and neutralizing spilled electrolyte, fire protection, protection of charging apparatus from damage by trucks, adequate ventilation for dispersal of fumes from gassing batteries.
• Precautions must be taken to prevent open flames, sparks, or electric arcs in battery charging areas.
• Reinstalled batteries must be properly positioned and secured in the truck.
• Smoking is prohibited in the charging area.
• Tools and other metallic objects must be kept away from the top of uncovered batteries.
• Trucks must be properly positioned and brake applied before attempting to change or charge batteries.
• When charging batteries, acid must be poured into water. Not water into acid.

**Maintenance**

• Any PIT not in safe operating condition must be removed from service. Those repairs to the fuel and ignition systems of forklifts that involve fire hazards must be conducted only in locations designated for such repairs.
• Authorized personnel must make all repairs.
• Forklifts must be examined before being placed in service, and must not be placed in service if the examination shows any condition adversely affecting the safety of the vehicle. Such examination must be made at least daily. Where forklifts are used on a round-the-clock basis, the forklifts must be examined before each shift. Any defects must be immediately reported and corrected.
• Forklifts shall be kept in a clean condition, free of lint, excess oil, and grease. Noncombustible agents must be used for cleaning trucks. Low flash point (below 100 degrees F) solvents must not be used. High flash point (at or above 100 degrees F) solvents may be used.
• Only use replacement parts that are currently recommended by the manufacturer.
• PIT in need of repairs to the electrical system must have the battery disconnected before such repairs.
• When the temperature of any part of any forklift is found to be in excess of its normal operating temperature, thus creating a hazardous condition, the vehicle must be removed from service and not returned to service until the cause for such overheating has been eliminated.

**Training requirements**

Employees who are authorized to operate forklifts must receive training prior to engaging in their duties, and at least every three years thereafter. The training is to ensure that the PIT program is understood.

The supervisor will also ensure that authorized forklift operators have acquired the necessary practical skills required for safe operation. Training is offered by EHS, and authorized department trainers.

Department trainers will be selected by their department, and approved by EHS. Department trainers must be experienced operators who have the knowledge, training, and skills necessary to evaluate the competence of trainees.

Operational training will consist of a combination of general safety instruction, practical/operational training (demonstrations performed by the trainer, and practical exercises performed by the trainee), and evaluation of the operator's performance in the workplace. All operational training must be conducted under close supervision.
Initial training

- All training and evaluation must be completed before an operator is permitted to use a forklift without continual and close supervision.
- Be informed of the forklift operating limitations and restrictions as defined by the manufacturer.
- During operational training, trainees may operate a PIT only under the direct supervision of authorized trainers, and where such operation does not endanger the trainee or other employees.
- Prior to operating any PIT the trainee will read and understand the manufacturer's operating instruction(s) and user's safety rules, or receive training by a qualified person on the contents of the manufacturer's operating instruction(s) and users safety rules.
- Receive instruction on the intended purpose and function of each control.
- Understand by reading or having a qualified person explain all decals, warnings, and instructions displayed on the PIT.

Refresher training

- A condition in the workplace changes in a manner that could affect safe operation of the truck.
- The operator has been observed operating the vehicle in an unsafe manner.
- The operator has received an evaluation that reveals that the operator is not operating the truck safely.
- The operators appear unfamiliar with their equipment, procedures, or appear to have inadequate knowledge concerning what is required by this program.
- There is a change in job assignments, change in equipment or process, or whenever there is a change in the PIT.
- To be conducted after an incident with removal of operator license.
- To be conducted every three years.

Refresher training - must include at least the following

- Review of the Pre-Use Inspection Checklist.
- Review of the university written program.
- Updated information on new equipment.

Training records

Each department must maintain a record of all individual training, including:
- Any refresher training conducted.
- Date of training.
- Name of individual trained.
- Name of person providing the training.
• Subject matter of the training (classroom, test and obstacle course performance).
• Training records must maintained by the department for a minimum of 3 years.

**Program evaluation**

• The PIT program shall be evaluated as necessary for compliance and effectiveness. Utilizing the protocols set forth by EHS. The evaluation team will consist of a department representative and a designee from Occupational Health and Safety. Occupational Health and Safety will define the scope of the evaluation. The final report will be developed by the department representative and OHS utilizing the information received during the evaluation. The deficiencies determined in the report will be documented and corrective action plans will be developed.
